

## Replacing T800 Series I Equipment in TaitNet Trunked Networks with the Series II Equivalent

18 November 1999

---

Tait can no longer supply some T800 Series I radio equipment. This technical note explains what to do if a T800 Series I receiver, transmitter, or exciter that is part of a Tait-Net trunked radio network needs to be replaced when Series I modules are no longer available.

You need to obtain the Series I compatible Series II equivalent of the module you want to replace (T8xx-xx-0300). The Series I compatibility enables the Series II module to fit into the T1500-56-232 (formerly T800-56) racks that house your trunked equipment. The modules must be modified as described below. (The existing fitting instructions for the T1500-50 and T1500-51 kits only apply to Series I equipment).

All modules need a second D-range. Transmitters or exciters need to be fitted with a T1500-51 trunking transmitter interface board. This technical note gives instructions for these modifications. Instructions and illustrations are for the T83x range but apply with minor variations to other ranges.

### Components required

T1500-50 kit, containing the following:

- 1 x D-range plug assembly and wires
- 1 x D-range socket (not required)
- 2 x locating pins, nuts, and washers

T1500-51 kit, containing the following:

- 1 x T1500-51 PCB complete with wires and sockets
- 2 x M3 x 8 mm Taptite screws
- 1 x T800-03 auxiliary D-range kit containing the following:

- 1 x D-range plug assembly
- 1 x D-range socket (not required)
- 2 x locating pins, nuts, and washers

**Note** These components could be recovered from the Series I equipment being replaced.

## Modifying the Receiver

1. Remove the two screws and cover plate over the second D-range mounting hole.
2. Take the D-range plug assembly. Insert its brown and red wires through the hole and position the assembly with the same orientation as the D-range already fitted.
3. Fit the locating pins through the D-range and chassis, securing each with a nut and washer.
4. Connect the brown wire (Audio FFSK Out) to P244, as shown in Figure 1.
5. Connect the red wire ( Line Monitor) to P284, as shown in Figure 2.

## Modifying the Transmitter or Exciter

1. Remove the T800 transmitter top and bottom covers.
2. Remove the cover plate from the second D-range mounting hold and fit the auxiliary D-range plug with the supplied locating pins, nuts, and washers.
3. Remove the shorting links from L and E and fit them to B and H (see Figure 3).
4. Fit the connector with the blue and violet wires to L (see Figure 3).
5. Fit the connector with the yellow and green wires to E (see Figure 3).
6. Connect the blue wire (TX-EN-OPT) to P215 or P217 (see Figure 3).
7. Connect the red wire (+9 V) to P230, P240, or P239 (see Figure 3).
8. Connect the black wire (GND) to P259, P261, or P263 (see Figure 4).

9. Connect the green wire (EXT FFSK) to pin 7 of the second D-range.
10. Connect the white wire (EXT PTT) to pin 13 of the second D-range.
11. Using the supplied screws, mount the T1500-51 PCB component-side down on the top pair of lugs (those nearest the carrier switch).
