

KENWOOD

SERVICE MANUAL

VHF DIGITAL TRANSCEIVER

NX-240, NX-240(V)

Note :

Lead free solder used in the board (material : Sn, Ag, In, Bi, melting point : 227 Centigrade)

TABLE OF CONTENTS

1	PRECAUTION.....	1-4
2	SPECIFIC SERVICE INSTRUCTIONS.....	1-4
3	DISASSEMBLY.....	1-13
4	ADJUSTMENT.....	1-16
5	TROUBLESHOOTING.....	1-22

This service manual is applied for Hardware Ver 2.0 transceivers (K, P, M, M2 types) with B52xxxx or subsequent serial numbers.

This product complies with the RoHS directive for the European market.

This product uses Lead Free solder.

Transceivers containing AMBE+2™ Vocoder: The AMBE+2™ voice coding technology is embedded in the firmware under the license of Digital Voice Systems, Inc.

SPECIFICATION

GENERAL		
Frequency Range		136~174MHz
Number of Channels		32
Zones		2
Max. Channels per zone		16
Channel Spacing	Analog	12.5/25kHz
	Digital	6.25/12.5kHz
Operating Voltage		7.5V DC \pm 20%
Battery Life Battery Saver OFF/ON (5-5-90 at high power with KNB-45L (2000mAh))		Approx. 10/12 hours
Operating Temperature Range		-30°C~+60°C (-22°F to +140°F)
Frequency Stability		\pm 2.0ppm
Antenna Impedance		50 Ω
Dimensions (W x H x D) (Projections not included)	with KNB-45L	54 x 122 x 35.3 mm (2.13 x 4.80 x 1.39 in)
Weight (net)	Radio only	165 g (5.8 oz)
	with KNB-45L	281 g (9.9 oz)
RECEIVER		
Sensitivity	Digital@6.25kHz	0.25 μ V (3% BER)
	Digital@12.5kHz	0.25 μ V (3% BER)
	Analog	0.25 μ V (EIA 12dB SINAD)
Selectivity	Analog@25kHz	70dB
	Analog@12.5kHz	60dB
Intermodulation Distortion	Analog	70dB
Spurious Response	Analog	70dB
Audio Distortion		Less than 10%
Audio Output		1W/12 Ω (Internal speaker) 500mW/8 Ω (External output)
TRANSMITTER		
RF Power Output	High/Low	5W/1W
Spurious Response		70dB
FM Hum & Noise	Analog@25kHz	45dB
	Analog@12.5kHz	40dB
Audio Distortion		Less than 10%
Modulation		16K0F3E, 11K0F3E, 4K00F1E, 4K00F1D, 4K00F7W, 4K00F2D, 8K30F1E, 8K30F1D, 8K30F7W

Analog measurements made per TIA/EIA-603 and specifications shown are typical.

Digital measurements made per NXDN CA1 and specifications shown are typical.

JVC KENWOOD Corporation reserves the right to change specifications without prior notice or obligation.

SECTION 1 PRECAUTION

This service manual does not describe PRECAUTION.

SECTION 2 SPECIFIC SERVICE INSTRUCTIONS

2.1 CIRCUIT DESCRIPTION

2.1.1 Frequency Configuration

The receiver utilizes double conversion. The first IF is 45.45MHz and the second IF is 450kHz. The first Local oscillator is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Figure 1 shows the frequencies.

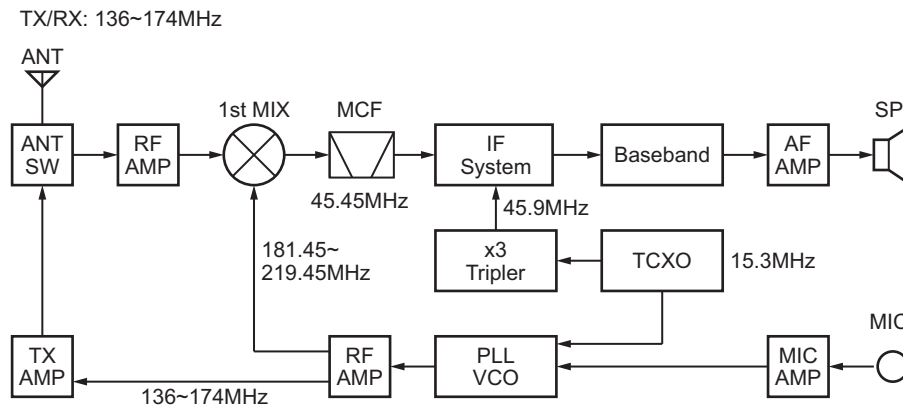

Fig.1 Frequency configuration

2.1.2 Receiver System

The receiver system is shown in Figure 2.

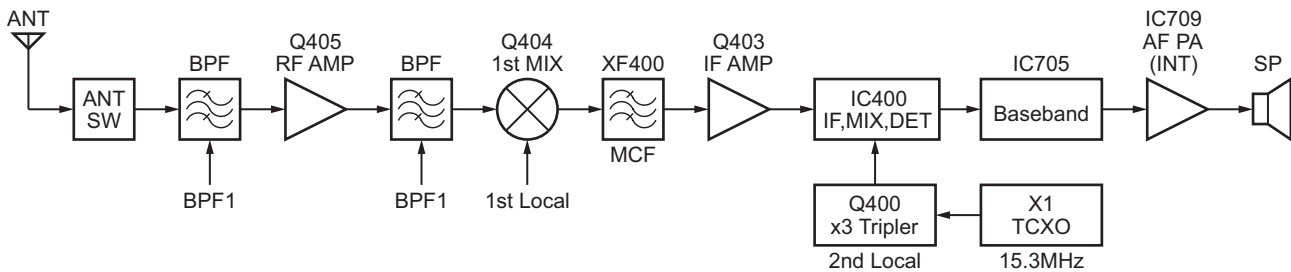

Fig.2 Receiver system

2.1.2.1 Front End (RF Amplifier) Circuit

The signal coming from the antenna passes through the transmit/receive switching diode circuit (D201, D202, D203 and D204) and a BPF (L415 and L416), and is then amplified by the RF amplifier (Q405).

The resulting signal passes through a BPF (L411) and goes to the mixer. The BPF is adjusted by variable capacitance diodes (D401, D402, D403 and D404). The input voltage to the variable capacitance diodes is the regulated voltage output from the DC amplifier (IC704).

2.1.2.2 First Mixer

The signal from the front end is mixed with the first local oscillator signal generated in the PLL circuit by Q404 to produce the first IF frequency of 45.45MHz.

The resulting signal passes through the XF400 MCF to cut the adjacent spurious and provide optimum characteristics, such as adjacent frequency selectivity.

2.1.2.3 IF Amplifier Circuit

The first IF signal is passed through a four-pole monolithic crystal filter (XF400) to remove the adjacent channel signal. The filtered first IF signal is amplified by the first IF amplifier (Q403) and is then applied to the IF system IC (IC400).

The IF system IC provides a second mixer, AGC+BPF, PLL FM detector, noise squelch and RSSI circuit.

The second mixer mixes the first IF signal (45.45MHz) with the signal of the second local oscillator output (Q400) and produces the second IF signal of 450kHz.

The second IF signal is passed through the internal bandpass filter of the IF system IC to remove the adjacent channel signal. The filtered second IF signal is amplified by the limiting amplifier and demodulated by the internal discriminator of the IF system IC.

The demodulated signal is routed to the audio circuit.

2.1.2.4 Audio Amplifier Circuit

The demodulated signal from IC400 is sent to an AF amplifier through IC705, and is routed to an audio power amplifier (INT:IC709, EXT:IC707) where it is amplified and output to the speaker.

Fig.3 Audio amplifier circuit

2.1.2.5 Squelch Circuit

Part of the AF signal from the IC400 enters the FM IC (IC400) again, and the noise component is amplified and rectified by a filter and an amplifier to produce a DC voltage corresponding to the noise level.

There are 2 noise filters. Analog Narrow band, NXDN Narrow band and NXDN Very Narrow band will share the same noise filter (W_N control is Low) where as analog wide band will use another noise filter (W_N control is HIGH).

The selection of different noise filter is by 2 multiplexer (IC719 and IC720).

The DC signal from the FM IC goes to the analog port of the MCU (IC710). IC710 determines whether or not to output sounds from the speaker by checking if the input voltage is higher or lower than the preset value.

To output sounds from the speaker, IC710 sends a high signal to the EXTSPSW line and turns IC707 on through Q709, Q710, Q713 and Q716. This explanation is for the external speaker amplifier. For the internal loudspeaker amplifier, IC710 sends a high signal to the INTSPSW line and turns IC709 on through Q711 and Q714.

2.1.3 Transmitter System

2.1.3.1 Microphone Amplifier Circuit

The signal from the microphone is limited by the AGC circuit, which is composed of D700, D701, Q705, Q706 and the mute switch (Q704). IC705 is composed of a high-pass filter, low-pass filter and pre-emphasis/IDC circuit.

The signal from the microphone and the low speed data from the MCU (IC710) enter the baseband IC (IC705) and pass through each path and are mixed inside the IC.

The output signal from the audio processor MOD2 goes to the VCO modulation input. The other output signal from MOD1 goes to the TCXO modulation input.

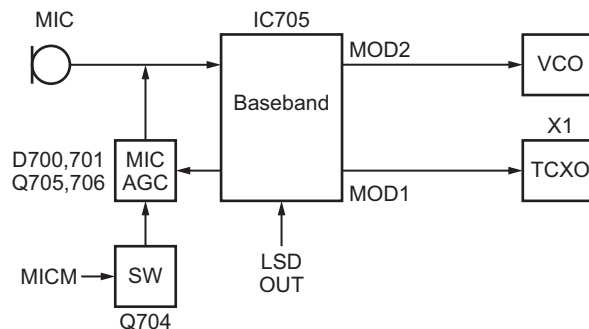

Fig.4 Microphone amplifier circuit

2.1.3.2 Drive and Final Amplifier Circuit

The signal from the T/R switch (D15 is on) is amplified by the pre-drive amplifier (Q201) to 20mW.

The output of the pre-drive amplifier is amplified by the drive amplifier (Q206) and the RF final amplifier (Q208) to 5.0W (1W when the power is low).

The drive amplifier and the RF final amplifier consist of two MOS FET stages.

The output of the RF final amplifier is then passed through the antenna switch (D203 and D204) and harmonic filter (LPF) and is applied to the antenna terminal.

2.1.3.3 APC Circuit

The APC circuit always monitors the current flowing through the drive amplifier (Q206) and RF power amplifier (Q208), and keeps it constant. The voltage drop at R230, R231 and R233 is caused by the current flowing through the RF final amplifier. This voltage is applied to the differential amplifier IC200 (1/2).

IC200 (2/2) compares the output voltage of IC200 (1/2) with the reference voltage from IC705 (32pin:AUXDAC1). The output of IC200 (2/2) controls the gate bias voltage of the RF power amplifier and the drive amplifier to make both voltages the same.

The change of power (high/low) is carried out by the change of the reference voltage.

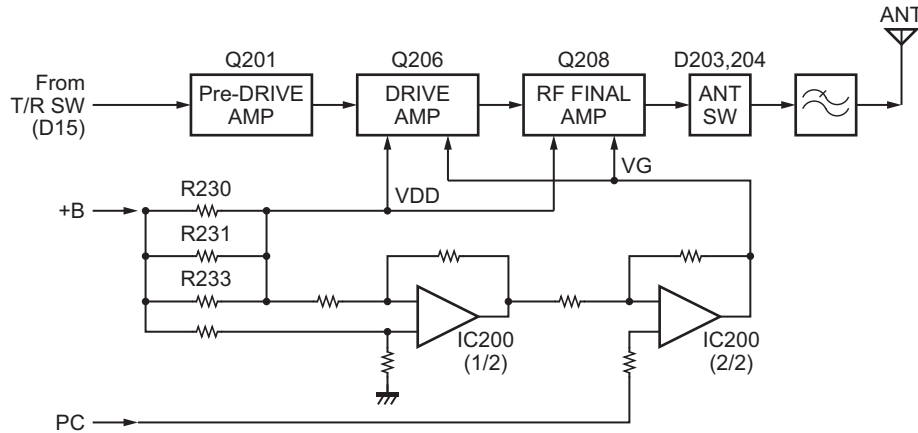

Fig.5 Drive and final amplifier and APC circuit

2.1.4 Frequency Synthesizer Unit

2.1.4.1 Frequency synthesizer

The frequency synthesizer consists of the TCXO (X1), VCO, PLL-IC (IC2), and buffer amplifiers.

The TCXO generates 15.3MHz. The frequency stability of TCXO is 0.45ppm within the temperature range of -30°C to +60°C. The frequency tuning and modulation of the TCXO are done to apply voltage to pin 1 of the TCXO. The TCXO output is applied to pin 10 of the PLL-IC.

The VCO consists of 2 VCOs and covers a dual range of 181.45~219.45MHz and 136~174MHz. The VCO generates 181.45~219.45MHz to provide the first local signal for reception. The operating frequency is generated by Q6 in transmitting mode and Q5 in receiving mode. The oscillation frequency is controlled by applying the VCO control voltage, obtained from the phase comparator (IC2) to the variable capacitance diodes (D3, D5, D8, D9, D11, and D13 while transmitting and D2, D4, D6, D7 and D12 while receiving).

The TX/RX pin of IC710 goes "high" in transmission mode, causing Q8 to turn off, and Q7 turn on. The TX/RX pin goes "low" in reception mode.

The output from Q5 and Q6 are amplified by a buffer amplifier (Q9) and RF amplifier (Q2), and are then sent to the PLL-IC. The PLL-IC consists of an 18-bit delta signal modulator, prescaler, reference divider, phase comparator, and charge pump.

The input signal from pin 10 and 17 of the PLL-IC is divided down and compared at the phase comparator. The pulse output signal of the phase comparator is applied to the charge pump and transformed into a DC signal in the loop filter (LPF). The DC signal is applied to the CV of the VCO and is locked to keep the VCO frequency constant.

PLL data is output from PLL_LE (pin 87), PLL_DATA (pin 86) and PLL_CLK (pin 88) of the MCU (IC710). The data is input to the PLL-IC when the channel is changed or when transmission is changed to reception and vice-versa. The PLL lock condition is always monitored by pin 70 (PLL_LD) of the MCU. When the PLL is unlocked, PLL_LD goes low.

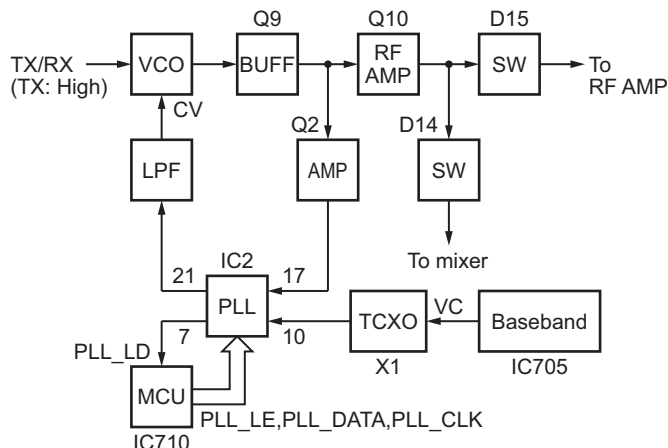

Fig.6 PLL block diagram

2.1.5 Control Circuit

The control consists of the MCU (IC710) and its peripheral circuits. It controls the TX-RX unit. IC710 mainly performs the following;

- (1) Switching between transmission and reception via the PTT signal input.
- (2) Reading channel information, frequency, and program data from the memory circuit.
- (3) Sending frequency program data to the PLL.
- (4) Controlling squelch on/off via the DC voltage from the squelch circuit.
- (5) Controlling the audio mute circuit via the decode data input.
- (6) Transmitting tone and encode data.

2.1.5.1 Frequency Shift Circuit

The MCU (IC710) and baseband IC (IC705) operate at a clock frequency of 19.2MHz.

The clock frequency can be shifted by 50ppm when the beat shift is checked in the FPU. This is implemented by applying the beat shift voltage of 3.2V to pin 1 of X2.

The beat shift function must be ON if there is any internal beat which is related to the 19.2MHz clock.

Fig.7 Frequency shift circuit

2.1.5.2 Memory Circuit

The Memory circuit consists of the MCU (IC710) and EEPROM (IC700). The EEPROM has a capacity of 64K-bit and stores the channel information, the last channel data, the scan on status, and other parameters.

■EEPROM

Note:

- The EEPROM stores tuning data (Deviation, Squelch, etc.).
- Realign the transceiver after replacing the EEPROM.

2.1.5.3 Low Battery Warning

The battery voltage is monitored by the MCU (IC710 pin 33: BATT). When the battery voltage falls below 6.4V approximately, the red LED blinks, notifying the operator that it is time to replace the battery (When "Always" option (default setting) under the Battery Warning function in the FPU is selected).

If the battery voltage falls below 5.8V approximately, the transceiver does not transmit and a warning tone beeps when the PTT switch is pressed (When the Battery Warning Tone is selected in the FPU).

2.1.5.4 Key Input

Keys and channel selector circuit.

The signal from the keys and channel selector are directly input to the MCU, as shown in Figure 8.

Fig.8 Key input

2.1.6 Signaling Circuit

2.1.6.1 Encode

■ Low-speed data (QT, DQT)

Low-speed data is output from pin 29 of the MCU. The signal passes through the low pass CR filter, and goes to the audio processor (IC705). The signal is mixed with the audio signal and goes to the VCO and TCXO (X1) modulation input after passing through the D/A converter inside the audio processor (IC705) for BAL adjustment.

■ High-speed data (2-tone,DTMF)

High-speed data (HSD) is output from pin 30 of the MCU. HSD deviation made by an adjustment in the MCU is passed through the low pass CR filter and is then mixed with the microphone signal before being applied to the baseband IC (IC705).

The output of the baseband IC, MOD1 and MOD2, will be fed into the TCXO and VCO respectively.

■ MSK (Fleet Sync/MDC-1200)

The MSK signal is generated in the audio processor (IC705). The signal passes through the D/A converter (inside the baseband IC: IC705) and is routed to the VCO. When encoding the MSK, the microphone input signal is muted.

2.1.6.2 Decode

■ QT/DQT

The output signal from the FM IC (IC400) enters the MCU (IC710) through IC705. IC710 determines whether or not the QT or DQT matches the preset value, and controls the AFSW and speaker output sounds according to the squelch results.

■ 2-tone

Part of the received AF signal output from the FM IC (IC400) passes through the baseband IC (IC705), and is compared and output from MOD2 before going to the MCU (IC710). IC710 checks whether or not the 2-tone data is necessary. If it matches, IC710 carries out a specified operation, such as turning the speaker on.

■ MSK (Fleet Sync)

The MSK input signal from the FM IC (IC400) goes to IC705. The decoded information is then processed by the MCU.

■ DTMF

The DTMF input signal from the FM IC (IC400) goes to IC705. The decoded information is then processed by the MCU.

2.1.7 Power Supply

There are five 5V power supplies and five 3.3V power supplies: 50M, 50V, 50C, 50R, 50T, 33M, 33MS, 33B, 33R and 33MD.

50M and 33M are always output while the power is on.

33MS is always output, but turns off when the power is turned off, to prevent a malfunction of the MCU.

50C is a common 5V and is output when SAVE is not set to ON.

50R is 5V for reception and is output during reception.

50T is 5V for transmission and is output during transmission.

50V is 5V for the SP/MIC connector.

33B is 3.3V for the baseband IC (IC705) digital supply.

33R is 3.3V for the IF IC (IC400).

33MD is 3.3V for the MCU digital supply.

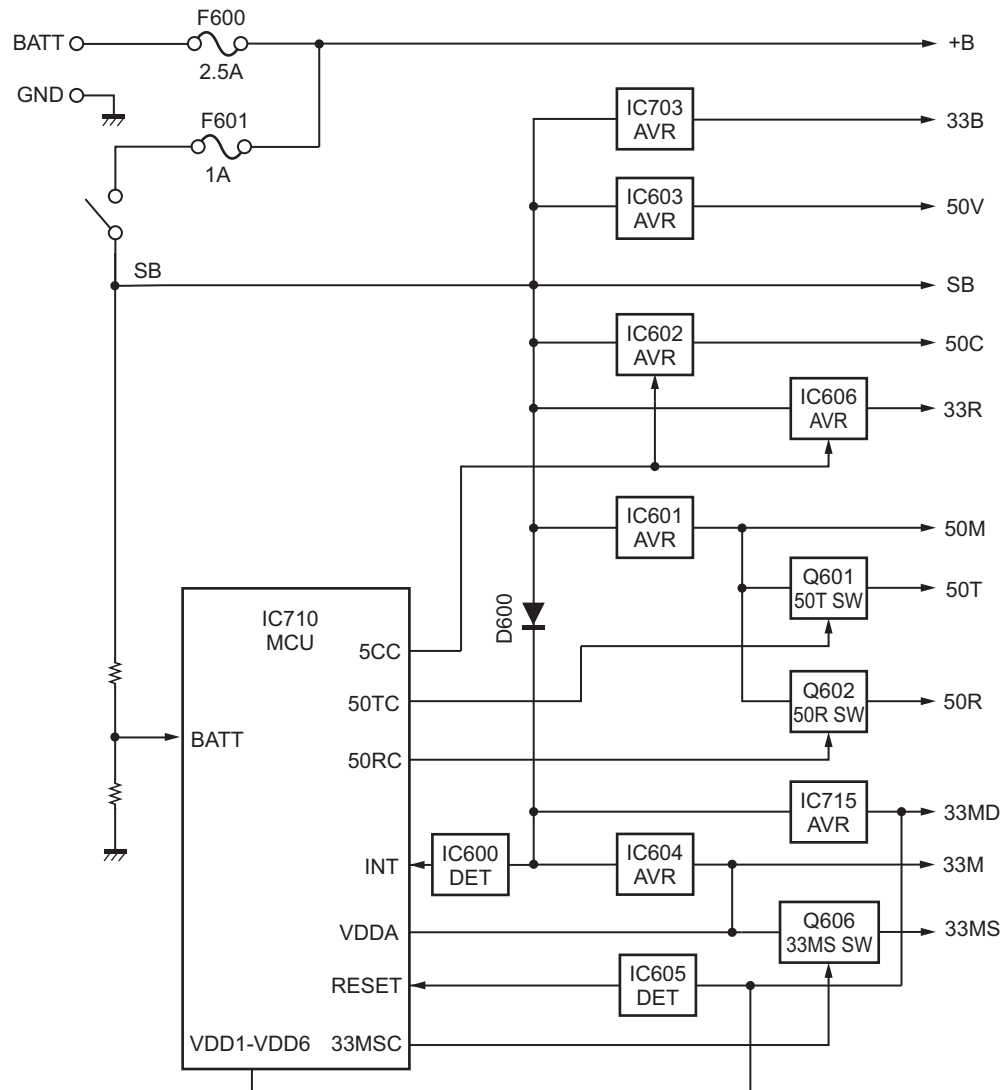

Fig.9 Power supply

2.1.8 NXDN Receiving

2.1.8.1 For Digital Data Mode

The demodulated signal from IC400 (Pin13) is fed into the baseband IC (Pin 16) for NXDN decoding. The decoded digital data will pass to the MCU through the C-BUS. The MCU determines whether or not to output sound from the speaker by checking if the data matches.

2.1.8.2 For Digital Voice Mode

If the digital data matches in the MCU, the digital voice payload data will go into the Vocoder in the MCU for conversion to PCM. The PCM data will go to the baseband IC through the SPI input, where it will be converted to analog by the DAC. Analog voice will be filtered and finally sent to the audio amplifier.

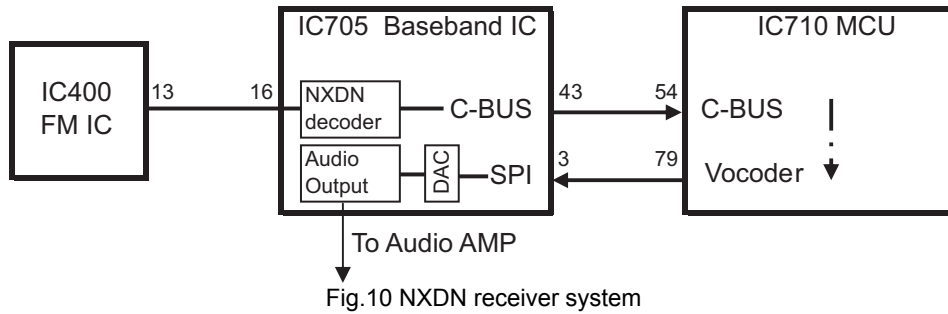

Fig.10 NXDN receiver system

2.1.9 NXDN Transmitting

2.1.9.1 For Digital Data Mode

The digital data will be generated by the MCU, where it will be passed to the baseband IC, through the C-BUS for the encoding process. The encoded data will finally transmit through the TCXO and VCO modulation.

2.1.9.2 For Digital Voice Mode

The analog voice from the microphone will go to the ADC (after the audio filter) to convert to PCM data. The PCM data will be sent to the Vocoder through the SPI output. The Vocoder will convert the PCM to NXDN protocol, where it will be sent to the baseband through the C-BUS. In the baseband IC, the data will be encoded and finally transmitted through the TCXO and VCO modulation.

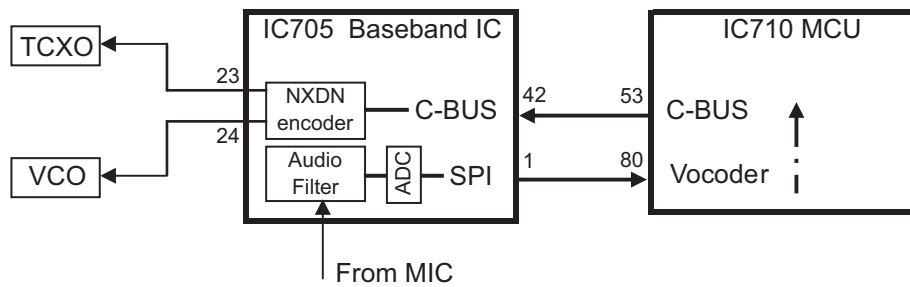

Fig.11 NXDN transmit system

2.2 SEMICONDUCTOR DATA

2.2.1 MCU: 2F405VGT6KFAA (TX-RX unit IC710)

Pin No.	Name	I/O	Function
1	MINVOL	O	Minimum volume control
2	DCSW	O	APC voltage discharge switch
3	APCSW	O	APC switch
4	TEST_1	O	Test land 1
5	TEST_2	O	Test land 2
6	VBAT	-	3.3V
7	BLUED	O	Blue LED light control (Hi: LED ON)
8	BSHIFT	O	MPU clock frequency shift
9	INSPMT	O	Internal speaker mute
10	VSS1	-	GND
11	VDD1	-	3.3V
12	XIN	I	Crystal (19.2MHz)
13	NC	O	No connection
14	NRST	I	MCU reset input
15	LSDI	I	QT/DQT decode
16	HSDDEC	I	2-tone decode

D703	Diode	Limiter
D754	Diode	1 pin detection

SECTION 3 DISASSEMBLY

3.1 Precautions for Disassembly

3.1.1 Removing the Case Assembly from the Chassis

- (1) Remove the selector knob <1> and volume knob <2>.
- (2) Remove the two screws <3>.
- (3) Lift and remove the chassis from the case assembly <4>.
(Use a flat-blade screwdriver to easily lift the chassis.)

3.1.2 Removing the Holder Assembly from the Chassis

- (1) Remove the packing <5> from the SMA, volume and selector.
- (2) Remove the holder from the chassis.

Note:

- Take care to not cut the speaker and microphone leads.
- (3) Detach the solder of the speaker and microphone leads from the PCB beforehand.
 - (4) Remove the packing <6> from the SP/MIC jack of the TX-RX unit.

Note: To remove the Holder Assy from the Chassis, use a flat-blade screwdriver and insert to this hole.

Note:

- You can remove the TX-RX unit from the chassis without removing the solder at the positive terminal. However, in this case, you cannot attach the packing (G53-2218-03) that is on the positive terminal to the chassis during assembly. So, we advise you to remove the solder on the positive terminal first.
- (4) Remove the FPC from the flat cable connector <10>.
 - (5) Lift and remove the TX-RX unit from the chassis <11>.

3.1.4 Removing the Battery Release Lever from the Case Assembly

- (1) Press the upper part of the lever toward the inside of the case assembly. One side of the shaft will be removed <1>.
- (2) Lift and remove the battery release lever from the case assembly <2>.

Note:

Scratch and widen the glue hole if you are having difficulty removing the other end of the shaft. No glue is required when you reassemble the battery release lever.

3.1.3 Removing the TX-RX unit from the Chassis

- (1) Remove the thirteen screws <7> fixing the TX-RX unit.
- (2) Remove the solder of the antenna terminal with a soldering iron <8>.
- (3) Remove the solder of the positive terminal with a soldering iron <9>.

3.2 Precautions for Reassembly

3.2.1 Attaching the Battery Release Lever to the Case Assembly

- (1) Insert one side of the shaft into the hole at the lever fitting section on the case assembly <1>.

Caution:

Position the thin spring (G01-4543-14) above the two tabs of the lever.

- (2) Tilt the battery release lever slightly forward <2>, so that the thick spring (G01-4542-04) is positioned below the case surface.
- (3) With the thick spring positioned below the case surface, attach the other side of the shaft to the case assembly by pressing the battery release lever <3> until it snaps into place <4>.

Caution:

Be careful to not tilt the battery release lever too far forward. If the battery release lever is pushed in this state where the two tabs come below the case surface, there is a possibility of damaging the two tabs.

3.2.2 Assembling the Battery Release Lever

- (1) Place the lever <2> onto the stopper <1>.
- (2) Place the thick spring <3> onto the lever.
- (3) Hook the right and left ends of the thin spring <4> onto the tabs of the stopper, then place the thin spring onto the lever <5>.
- (4) Slide the shaft through the hole of the stopper and lever <6>.

3.2.3 Attaching the Positive Terminal to the Chassis

Always attach the positive terminal to the chassis using the following procedures, before mounting the TX-RX unit onto the chassis.

- (1) Remove the holder assembly <2> from the packing <1> of the positive terminal.
- (2) Mount the packing of the positive terminal into the chassis hole <3>.
- (3) Mount the holder assembly into the packing of the positive terminal <4>.

3.2.4 Mounting the Chassis to the Case Assembly

- (1) Confirm that the waterproof packing attached to the circumference of the chassis is securely inserted in the groove of the chassis <1>.
- (2) Insert the upper part of the chassis into the case assembly <2>.
- (3) Press the chassis <3> and the case assembly together to attach them.

Caution:

If the packing of the SP/MIC is not at the correct position after attaching the chassis to the case assembly, reposition the packing with your fingers.

3.2.5 Attaching the Antenna Receptacle to the Chassis

Screw the antenna receptacle to the chassis in the order shown in the drawing so that the antenna receptacle comes to the center of the case hole.

3.2.6 The Nuts of the Volume Knob and Channel Knob

Note that the shape, color and height of the nuts of the volume knob and channel knob are different from one another. (The nut of volume knob is silver, and the nut of channel knob is gold.) Use the following jig when removing the nuts of the volume knob and channel knob:

- Jig (Part No.: W05-1012-00)

SECTION 4 ADJUSTMENT

4.1 Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range	100 to 520MHz
	Modulation	Frequency modulation and external modulation
	Output	-127dBm/0.1μV to greater than -47dBm/1mV
2. Power Meter	Input Impedance	50Ω
	Operation Frequency	100 to 520MHz
	Measuring Range	Vicinity of 10W
3. Deviation Meter	Frequency Range	100 to 520MHz
4. Digital Volt Meter (DVM)	Measuring Range	10mV to 10V DC
	Input Impedance	High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range	10Hz to 1000MHz
	Frequency Stability	0.2ppm or less
7. Ammeter		5A
8. AF Volt Meter (AF VM)	Frequency Range	50Hz to 10kHz
	Voltage Range	1mV to 10V
9. Audio Generator (AG)	Frequency Range	50Hz to 5kHz or more
	Output	0 to 1V
10. Distortion Meter	Capability	3% or less at 1kHz
	Input Level	50mV to 10Vrms
11. 8Ω Dummy Load		Approx. 8Ω, 3W
12. Regulated Power Supply		5V to 10V, approx. 3A Useful if ammeter equipped

*The test equipment which is not used for adjustment is contained in this table.

■Antenna connector adapter

The antenna connector of this transceiver uses an SMA terminal.

Use an antenna connector adapter [SMA(f) - BNC(f) or SMA(f) - N(f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

■Repair Jig (Chassis)

Use jig (Chassis) for repairing the transceiver. Place the TX-RX unit on the jig and fit it with screws.

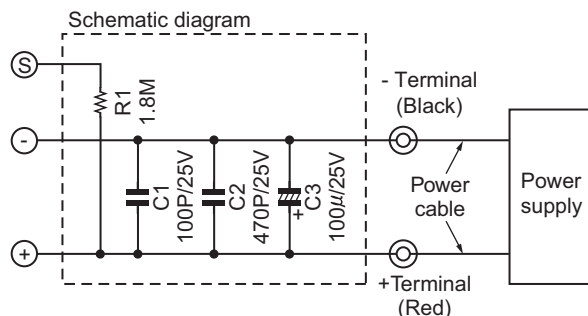

The jig facilitates the voltage check and protects the final amplifier FET when the voltage on the flow side of the TX-RX unit is checked during repairs.

■Battery Jig (W05-1011-00)

Connect the power cable properly between the battery jig installed in the transceiver and the power supply, and be sure output voltage and the power supply polarity prior to switching the power supply ON, otherwise over voltage and reverse connection may damage the transceiver, or the power supply or both.

Note:

When using the battery jig, you must measure the voltage at the terminals of the battery jig. Otherwise, a slight voltage drop may occur within the power cable, between the power supply and the battery jig, especially while the transceiver transmits.

4.2 Frequency and Signaling

The transceiver has been adjusted for the frequencies shown in the following table. When required, readjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

■Test frequency

CH	RX (MHz)	TX (MHz)
1	155.05000	155.10000
2	136.05000	136.10000
3	173.85000	173.90000
4	155.00000	155.00000
5	155.20000	155.20000
6	155.40000	155.40000
7~16	-	-

■Analog mode signaling

No.	RX	TX
1	None	None
2	None	20 Hz Square Wave
3	QT 67.0 Hz	QT 67.0 Hz
4	QT 151.4 Hz	QT 151.4 Hz
5	QT 210.7 Hz	QT 210.7 Hz
6	QT 254.1 Hz	QT 254.1 Hz
7	DQT D023N	DQT D023N
8	DQT D754I	DQT D754I
9	DTMF Decode (Code: 159D)	DTMF Encode (Code: 159D)
10	None	DTMF (Code: 9)
11	None	MSK (1010..)
12	FleetSync: 100-1000	FleetSync: 100-1000
13	None	Single Tone: 1000 Hz
14	2-tone Decode: A: 304.7 Hz B: 3106.0 Hz	2-tone Encode: A: 304.7 Hz B: 3106.0 Hz
15	None	DTMF Tone: 1477 Hz
16	Single Tone: 979.9 Hz	Single Tone: 979.9 Hz
17	None	MSK PN9
18	None	DTMF (Code: 3)

■NXDN mode signaling

No.	RX	TX
1	RAN1	RAN1
2	None	PN9
3	RAN1	Maximum Deviation Pattern
4	FSW+PN9	Mod set-up *1
5	Tone Pattern (1031 Hz)	Tone Pattern (1031 Hz)

RAN: Radio Access Number

PN9: Pseudo-Random Pattern (for production only)

*1: To output 150Hz square wave (for production only)

4.3 Preparations for Tuning the Transceiver

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

Whenever the transmitter is tuned, the unit must be connected to a suitable dummy load (i.e. power meter).

The speaker output connector must be terminated with a 8Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.

■5 reference level adjustments frequency

TEST CH	RX (MHz)	TX (MHz)
Low	136.05000	136.10000
Low'	145.55000	145.50000
Center	155.05000	155.10000
High'	164.55000	164.50000
High	173.85000	173.90000

4.4 Adjustment Points

4.5 Common Section

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Setting	1) Power supply voltage DC power supply terminal : 7.5V							
2. Receive Assist voltage	1) Auto tuning *Note 1					FPU		4.0 ± 0.1V
	2) CH: Low *Note 2	DVM	TX-RX	CVIN			Check	0.6V or more (at CVIN terminal)
3. Transmit Assist voltage	1) Auto tuning *Note 1					FPU		4.0 ± 0.1V
	2) CH: Low *Note 2	DVM	TX-RX	CVIN			Check	0.6V or more (at CVIN terminal)

***Note 1:**

During test mode, click the [Tune Assist Voltage] button in test mode dialog box, then start automatic adjustment of the Receiver/ Transmit assist voltage.

***Note 2:**

The CV voltage checking of CH:2 (Default value) test frequency must be performed in test mode.

4.6 Transmitter Section

Item	Condition	Measurement			Adjustment			Specifications /Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Frequency	(1)TEST CH: Center PTT ON	Frequency counter		ANT		FPU	155.100MHz	±30Hz

(NXDN Very Narrow)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -120dBm (0.22uV) AF Freq : 1kHz Mod Dev : ±1.5kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	
(NXDN Narrow)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -120dBm (0.22uV) AF Freq : 1kHz Mod Dev : ±1.5kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	
5. High RSSI (Analog Narrow)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -80dBm (22.4uV) AF Freq : 1kHz Mod Dev : ±1.5kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	
(Analog Wide)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -80dBm (22.4uV) AF Freq : 1kHz Mod Dev : ±3.0kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	
(NXDN Very Narrow)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -80dBm (22.4uV) AF Freq : 1kHz Mod Dev : ±1.5kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	
(NXDN Narrow)	(1)TEST CH: Low, Center, High (3 point) (2)SSG output: -80dBm (22.4uV) AF Freq : 1kHz Mod Dev : ±1.5kHz	SSG Oscilloscope Audio Analyzer		ANT		FPU	Press [Start] (Auto tuning)	

***Note 5:**

(1) Only RX Sensitivity (Semiautomatic) needs to be adjusted (RX Sensitivity does not need to be adjusted again).

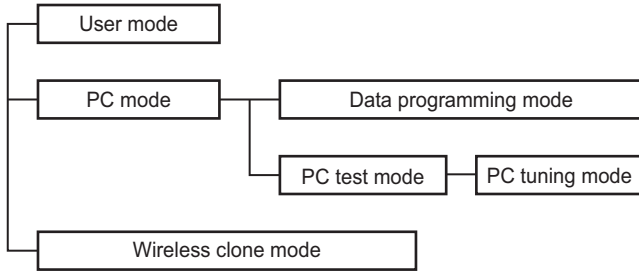

SECTION 5 TROUBLESHOOTING

5.1 SYSTEM SET-UP

5.2 REALIGNMENT

5.2.1 Modes

Mode	Function
User mode	For normal use.
PC mode	Used to communication between the transceiver and PC.
Data programming mode	Used to read and write frequency data and other features to and from the transceiver.
PC test mode	Used to check the transceiver using the PC. This feature is included in the FPU.
Wireless clone mode	Used to transfer programming data from one transceiver to another.

5.2.2 How to Enter Each Mode

Mode	Operation
User mode	Power ON
PC mode	Received commands from PC
Wireless clone mode	[PTT] + [Side2] + Power ON (Two seconds)

5.2.3 PC Mode

5.2.3.1 Preface

The transceiver is programmed by using a personal computer, a programming interface (KPG-22A/22U) and the FPU (programming software).

The programming software can be used with a PC. Figure 1 shows the setup of a PC for programming.

Fig.1

5.2.3.2 Connection procedure

- (1) Connect the transceiver to the computer using the interface cable.

Note:

- You must install the KPG-22U driver in the computer to use the USB programming interface cable (KPG-22U).
- (2) When the Power is switched on, you can immediately enter user mode. When the PC sends a command, the transceiver enters PC mode. When data is transmitting from the transceiver, the red LED lights. When data is being received by the transceiver, the green LED lights.

Note:

- The data stored in the computer must match the "Model Name and Model Type" when it is written into the EEPROM.
- Do not press the [PTT] key during data transmission or reception.

5.2.3.3 KPG-22A description (PC programming interface cable: Option)

The KPG-22A is required to interface the transceiver with the computer. It has a circuit in its D-sub connector (KPG-22A: 9-pin) case that converts the RS-232C logic level to the TTL level. The KPG-22A connects the SP/MIC connector of the transceiver to the RS-232C serial port of the computer.

5.2.3.4 KPG-22U description (USB programming interface cable: Option)

The KPG-22U is a cable which connects to a USB port on a computer.

When using the KPG-22U, install the supplied CD-ROM (with driver software) in the computer. The KPG-22U driver runs under Windows XP, Vista, 7 or 8.

The latest version of the USB driver is available for download from the following URL:

<http://www.kenwood.com/usb-com/>

(This URL may change without notice.)

5.2.3.5 Programming software description

The FPU is the programming software for the transceiver supplied on a CD-ROM. This software runs under Windows XP, Vista, 7 or 8 on a PC. The software on this disk allows a user to program the transceiver via the Programming interface cable (KPG-22A/22U).

- Use the FPU that matches the market when you first set the market code and model name/frequency data to the service unit. A unit set by mistake cannot be restored.

- List of FPU for transceiver

Model	Type	FPU
NX-240	K, P, M, M2	KPG-169D
NX-240(V)	K	KPG-170D

5.2.3.6 Programming with a PC

If data is transferred to the transceiver from a PC with the FPU, the data for each set can be modified.

Data can be programmed into the EEPROM in RS-232C format via the SP/MIC jack.

In this mode, the PTT line operate as TXD and RXD data lines, respectively.

5.2.4 Wireless Clone Mode

5.2.4.1 Outline

“Wireless Clone Mode” copies the transceiver data to another transceiver.

The dealer can copy the transceiver data to another transceiver even without the use of a personal computer.

5.2.4.2 Example

The transceiver can copy the programming data to one or more transceivers via RF communication.

The clone source and clone target(s) must be in wireless clone mode.

5.2.4.3 Operation

- (1) To switch the clone target(s) to Wireless Clone mode, press and hold the [PTT] and [Side2] keys while turning the transceiver power ON.
- (2) Wait for 2 seconds. The LED will light orange and the transceiver will announce “Clone”.

- (3) Select a channel table number using the Side1 (increment channel table) and Side2 (decrement channel table) keys.
- (4) To switch the clone source to wireless clone mode, press and hold the [PTT] and [Side2] keys while turning the transceiver power ON.
- (5) Wait for 2 seconds. The LED will light orange and the transceiver will announce “Clone”.
- (6) Select the same channel table number as the clone target(s).
- (7) Press [PTT] on the clone source to begin data transmission.
When the clone target starts to receive data, the LED will light green.
When the clone source finishes sending data, a “confirmation” tone will sound.
If data transmission fails while cloning, an “error” tone will sound from the target unit.
- (8) If the cloning fails, no data will be available in the target unit when it is returned to User mode.
- (9) When the cloning is successful, the target unit’s “Scan” and “Key lock” functions will return to their default values (Scan = OFF, Key lock = OFF).

Note:

- The dealer can clone data to two or more transceivers by repeating the above procedures.
- If the transceiver’s wireless clone Mode is configured as “Disabled”, it cannot enter Clone mode.
- The table shown in the next page covers the frequencies used for wireless cloning.
- Wireless clone mode cannot be entered in battery low state.
- A unit cannot be a “Source Unit” if it is not programmed. If [PTT] is pressed, an “error” tone will sound.
- The language available is only English.
- Once a unit is set to be the source, it cannot be a target after the data has been transmitted. This protects the data in the source unit.
- Electronic interface may cause a failure in data transfer during Wireless Cloning, such as when waveforms or electromagnetic fields are being performed at the workbench.
- **Wireless clone mode can be used ONLY by authorized service personnel.**
- **The wireless clone mode setting must be configured as “Disable” before being delivered to the end-user.**
- **To clone, replace the antenna from both the source transceiver and the target transceiver with a dummy load.**
- **The transmit output power is automatically set to Low in clone mode.**
- **Wireless clone mode does not function if Read Authorization Password or Overwrite Password has been configured in Data Password.**

• Clone frequency table

No.	Operating frequency 136~174 (MHz)
1	136.150
2	138.150
3	140.150
4	142.150
5	144.150
6	146.150
7	148.150
8	150.150
9	152.150
10	154.150
11	156.150
12	158.150
13	160.150
14	162.150
15	164.150

17	168.150
18	170.150
19	172.150
20	174.150

5.3 Replacing TX-RX Unit

■ TX-RX unit Information

Model Name	Original TX-RX unit Number	For Service TX-RX unit Number
NX-240 K	X57-8500-10	XC2-0090-10
NX-240V K	X57-8500-10	XC2-0090-11
NX-240 P	X57-8500-10	XC2-0091-01
NX-240 M	X57-8500-10	XC2-0090-21
NX-240 M2	X57-8500-10	XC2-0090-22

■ Supplied Accessories of "Service TX-RX unit"

Item (Including Parts Number)	Quantity
TX-RX Unit (XC2-009)	1
Model Name Plate	1

■ "Service TX-RX unit" Data

The following data is written on the service TX-RX unit:

Data Type	Description
Firmware	NX-240/340 Firmware
FPU Data (PC programming mode)	XC2-009 (NX-240/240V) K type data. XC2-009 (NX-240) P type data. XC2-009 (NX-240) M type data.
KENWOOD ESN	Model name: NX-240 or NX-240V Type: K, P or M The same number as the Model Name Plate label is written.
NXDN ESN	The same number as the Model Name Plate label is written.

■ After Changing the PCB

- (1) Using the KPG-169D (NX-240) / KPG-170D (NX-240V), select your desired item (Model Name and Frequency) from the Model> Product Information menu, then use Program> Write Data to the Transceiver to write the FPU data (PC Programming mode). When writing to the transceiver, a Warning Message, corresponding to the item selected, appears. Click [OK] to continue writing the data.
- (2) Enter Program> Test Mode, then adjust the various adjustment data (PC Test Mode) as described in the "SECTION 4 ADJUSTMENT" .
- (3) Attach the new labels corresponding to the new printed circuit board. (Refer to the images below for label placement.)
- (4) If necessary, write the FPU data used by the customer with the KPG-169D (NX-240) / KPG-170D (NX-240V).

Note:

- When a new printed circuit board is used, the KENWOOD ESN changes, as does the Transceiver Information display of the KPG-169D (NX-240) / KPG-170D (NX-240V), but this does not have any effect on the operation of the transceiver.
- If changing to the original ESN, please contact our service center.

■ Model Name Plate Label Layout

5.4 TERMINAL FUNCTION

5.4.1 TX-RX unit (X57-8500-10)

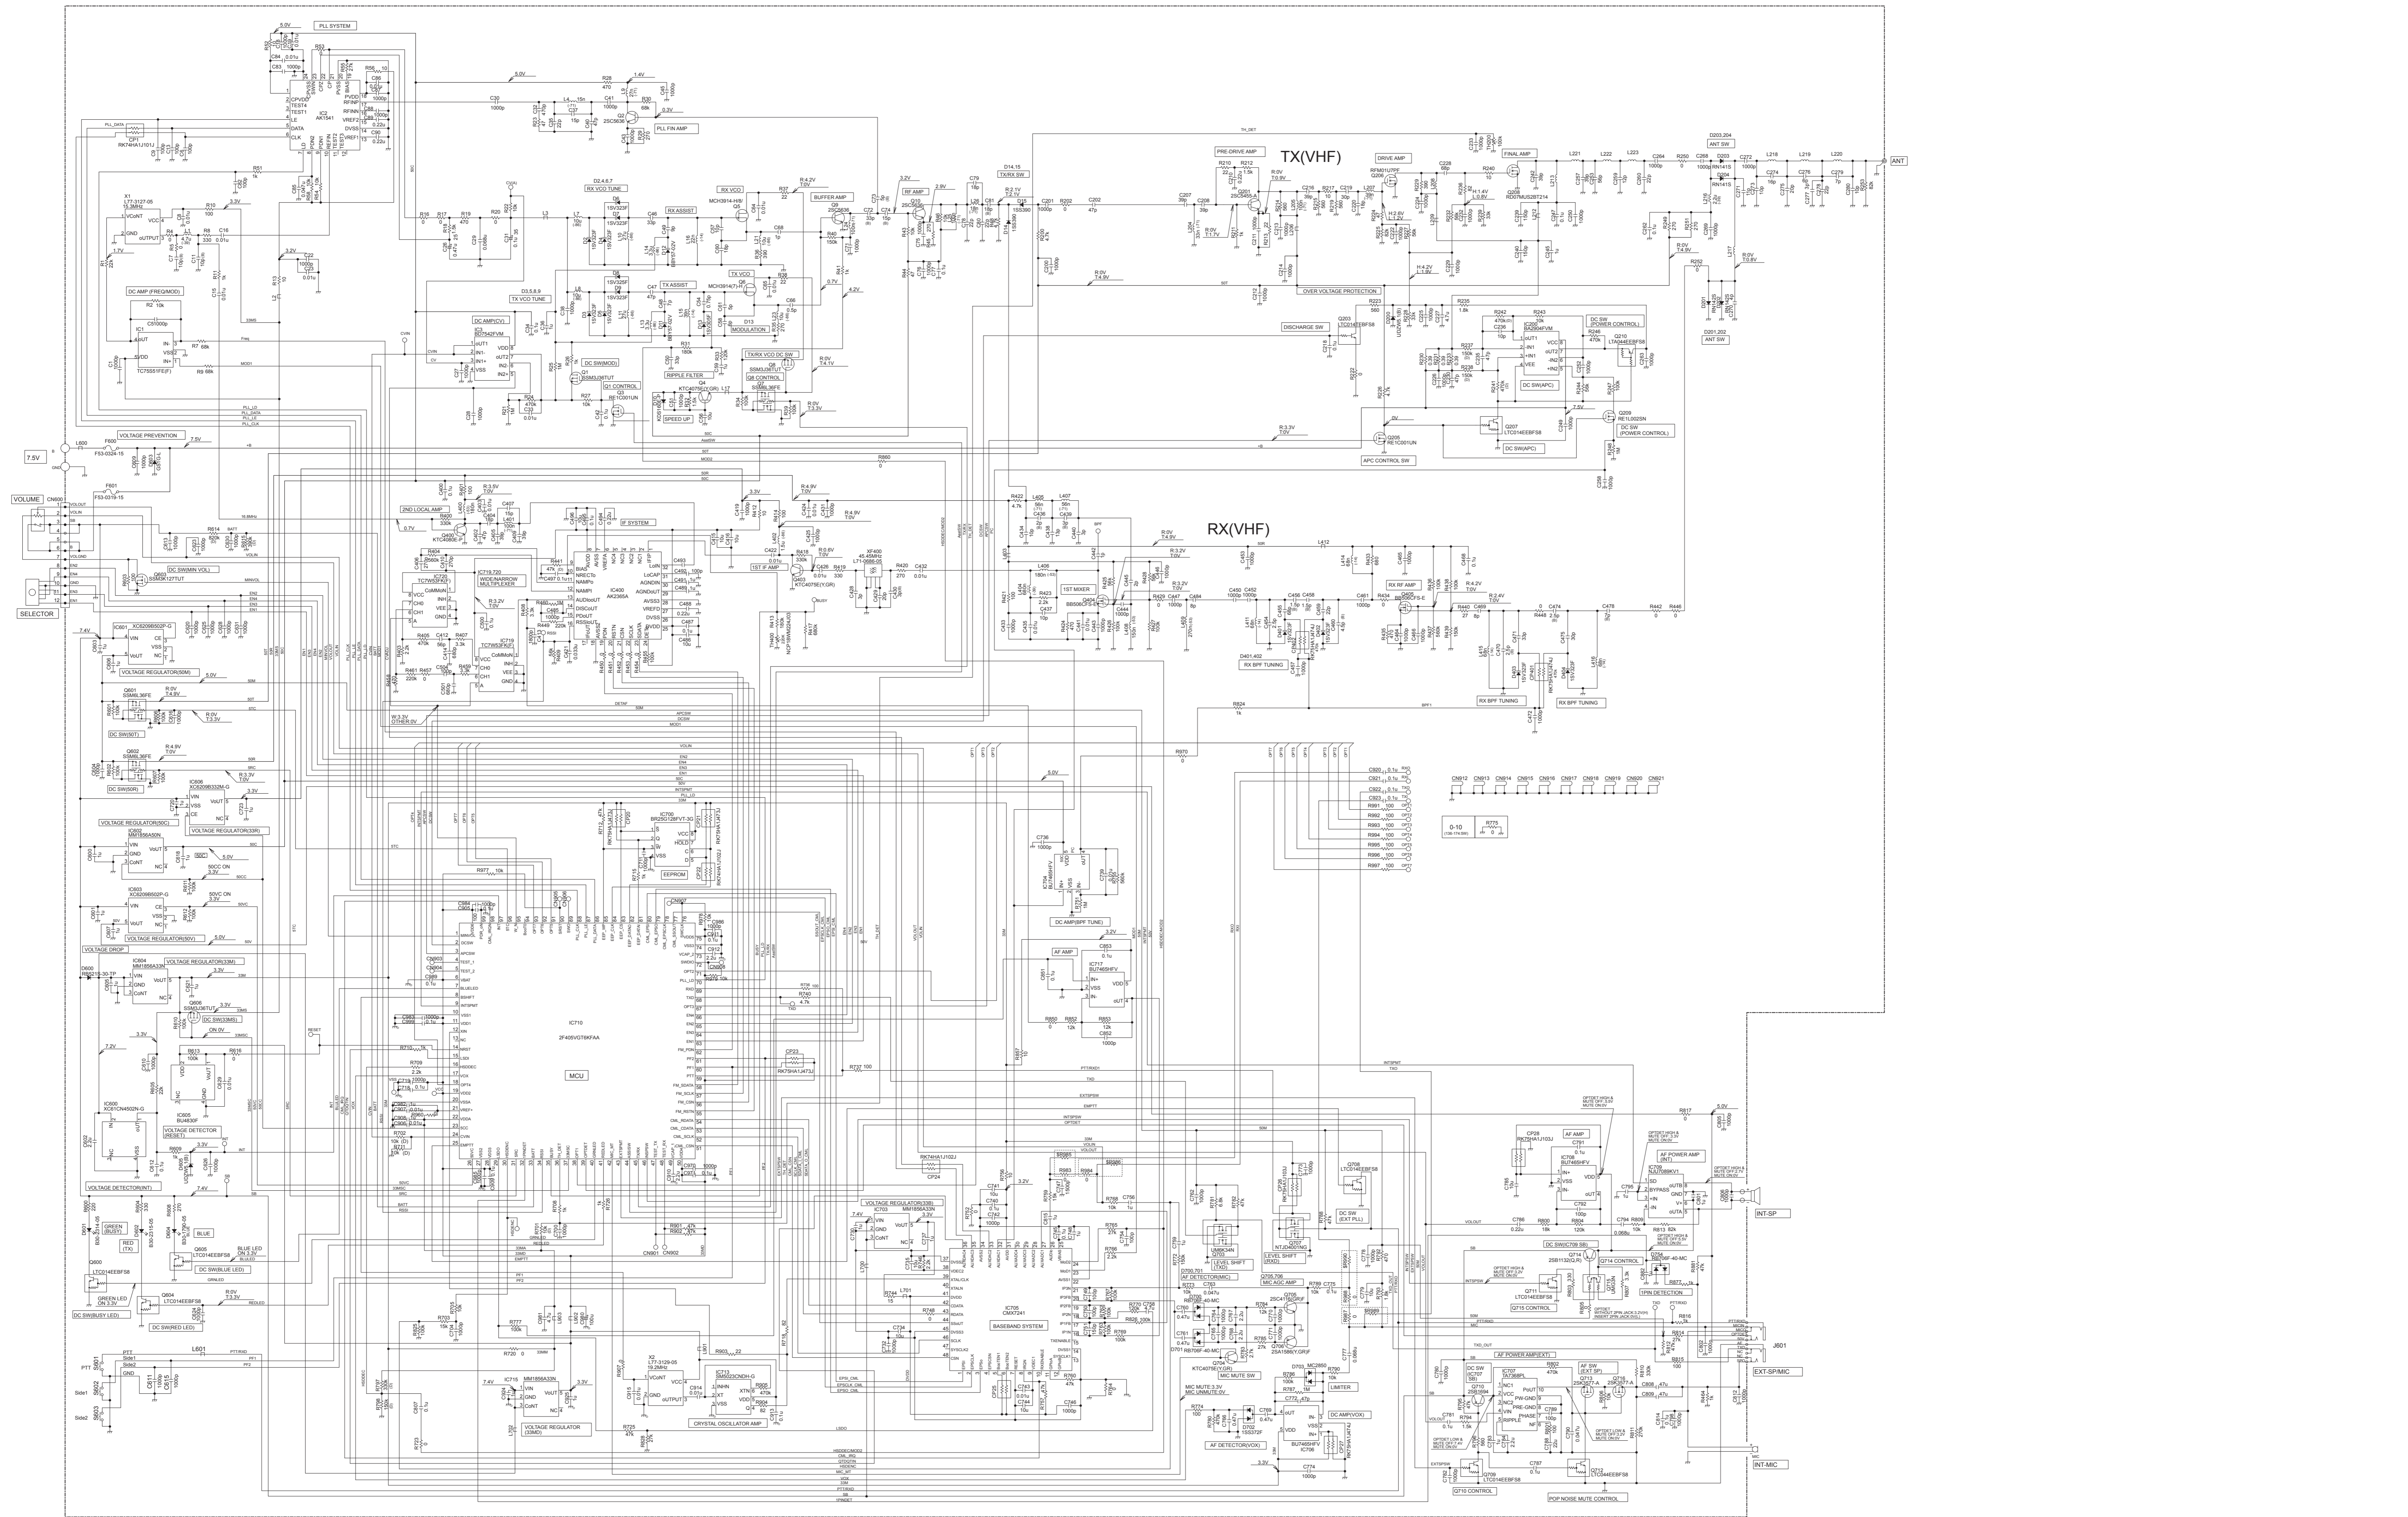

Pin No.	Name	I/O	Function
CN600			
1	VOLOUT	O	Volume output to audio amplifier
2	VOLIN	I	Volume level input for audio control
3	SB	I	Power input after power switch
4	SB	I	Connect to pin 3
5	B	O	Power output after passing through the fuse
6	B	O	Connect to pin 5
7	VOLGND	-	GND for volume level
8	EN2	I	Rotary switch input
9	EN4	I	Rotary switch input
10	GND	-	GND
11	EN3	I	Rotary switch input
12	EN1	I	Rotary switch input

5.4.2 SP/MIC Connector Specification

Pin No.	Name	I/O	Signal Type	Function
1	PTT/RXD	I	Digital	PTT/RXD input
2	MICIN	I	Analog	External MIC input
3	MICO	O	Analog	Internal MIC output
4	OPTDET	I	Digital	External option detection
5	50V	O	Power	DC 5V output
6	AE	-	GND	GND
7	TXD	O	Digital	TXD output
8	NC	-	-	No connection
9	NC	-	-	No connection
10	SPO	O	Analog	Internal audio output

PARTS LIST

[NX-240,NX-240(V)]

* SAFETY PRECAUTION

Parts identified by the \triangle symbol are critical for safety. Replace only with specified part numbers.

* BEWARE OF BOGUS PARTS

Parts that do not meet specifications may cause trouble in regard to safety and performance. We recommend that genuine parts be used.

* (x_) in a description column shows the number of the used part.
