INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication date. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

PERSONAL SAFETY

The following precautions are recommended for personal safety:

- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

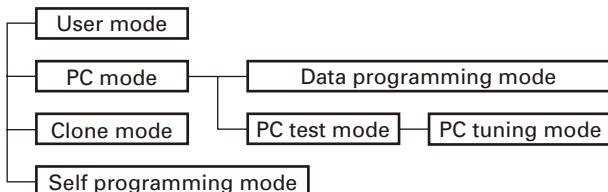

SERVICE

This transceiver is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

Destination	Number Of CH	Frequency No. / Frequency	Factory default CH setting	RF power output
M	8 channel	CH1 463.975MHz CH2 464.125MHz CH3 464.175MHz CH4 464.325MHz CH5 464.375MHz	CH1 463.975MHz / QT 94.8Hz CH2 464.125MHz / QT 88.5Hz CH3 464.175MHz / QT 103.5Hz CH4 464.325MHz / QT 79.7Hz CH5 464.375MHz / QT 107.2Hz CH6 OFF CH7 OFF CH8 OFF	2W

REALIGNMENT

1. Modes

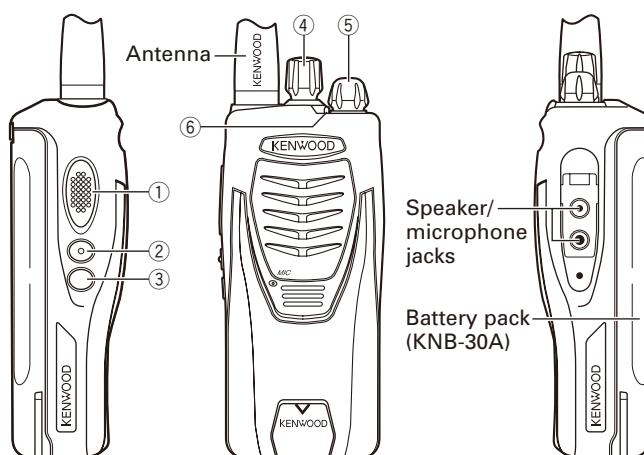

Mode	Function
User mode	For normal use.
PC mode	Used for communication between the transceiver and PC.
Data programming mode	Used to read and write frequency data and other features to and from the transceiver.
PC test mode	Used to check the transceiver using the PC. This feature is included in the KPG-88D(M2).
Clone mode	Used to transfer programming data from one transceiver to another.
Self programming mode	Used to program the transceiver without any external programming device.

2. How to Enter Each Mode

Mode	Operation
User mode	Power ON
PC mode	Received commands from PC
Clone mode	[PTT]+[Side2]+Power ON (Two seconds)
Self programming mode	[PTT]+[Side1]+Power ON (Two seconds)

3. Getting Acquainted

- ① PTT (Push to Talk) switch
Press and hold, then speak into the microphone to transmit.
- ② Side 1 key
Super lock (default).
- ③ Side 2 key
Scan + Temporary delete (default)
- ④ Channel selector
Rotate to change the operating channel.

5. Power switch/Volume control

Turn clockwise to switch the power ON and counter-clockwise to switch the power OFF. Rotate to adjust the volume.

6. LED indicator

Indicates the transceiver status. Lights red while transmitting, green while receiving, and flashes red when the battery power is low while transmitting.

4. PC Mode

4-1. Preface

The transceiver is programmed by using a personal computer, a programming interface (KPG-22/22A, USB adapter (KCT-53U)) and programming software (KPG-88D(M2)).

The programming software can be used with a PC. Figure 1 shows the setup of a PC for programming.

4-2. Connection Procedure

1. Connect the transceiver to the personal computer with the interface cable and USB adapter (when the interface cable is KPG-22A, the KCT-53U can be used.).

Notes:

- You must install the KCT-53U driver in the computer to use the USB adapter (KCT-53U).
- When using the USB adapter (KCT-53U) for the first time, plug the KCT-53U into a USB port on the computer with the computer power ON.
- 2. When the POWER is switched on, user mode can be entered immediately. When the PC sends a command, the transceiver enters PC mode.
When data is transmitting from the transceiver, the red LED lights.
When data is received by the transceiver, the green LED lights.

Notes :

- The data stored in the personal computer must match Model Name when it is written into EEPROM.
- Change the transceiver to PC mode, then attach the interface cable.

4-3. KPG-22/KPG-22A Description

(PC programming interface cable : Option)

The KPG-22/22A is required to interface the transceiver with the computer. It has a circuit in its D-sub connector (KPG-22: 25-pin, KPG-22A: 9-pin) case that converts the RS-232C logic level to the TTL level.

The KPG-22/22A connects the SP/MIC connector of the transceiver to the RS-232C serial port of the computer.

4-4. KCT-53U Description (USB adapter : Option)

The KCT-53U is a cable which connects the KPG-22A to a USB port on a computer.

When using the KCT-53U, install the supplied CD-ROM (with driver software) in the computer. The KCT-53U driver runs under Windows 2000 or XP.

REALIGNMENT

4-5. Programming Software Description

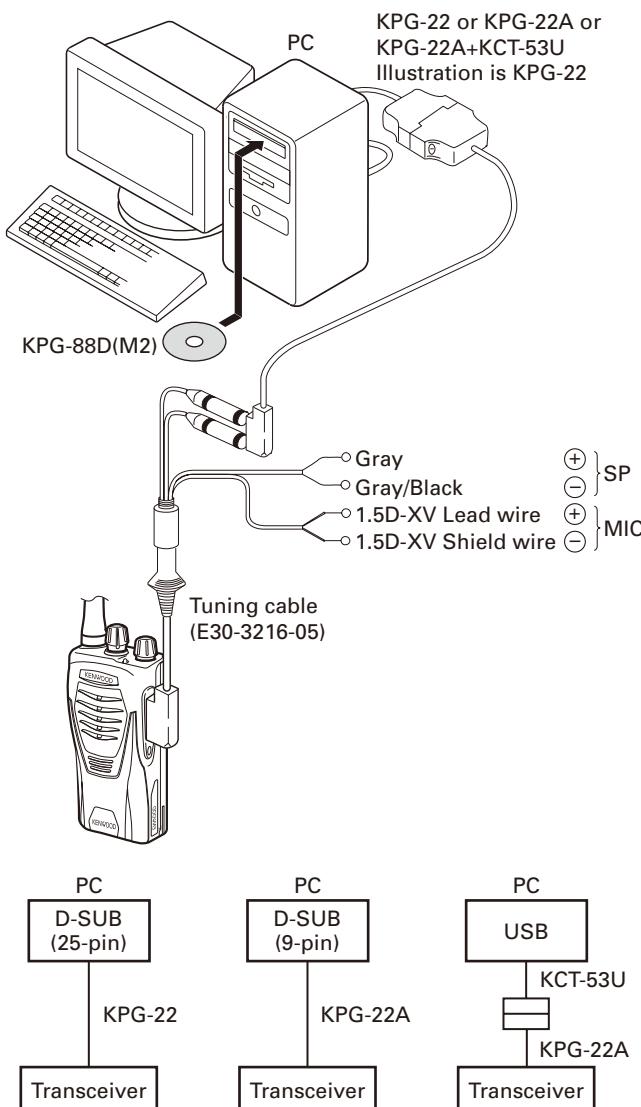

The KPG-88D(M2) is the programming software for the transceiver supplied on a CD-ROM. The software on this disk allows a user to program the transceiver radios via Programming interface cable (KPG-22/22A).

4-6. Programming with PC

If data is transferred to the transceiver from a PC with the KPG-88D(M2), the data for each set can be modified.

Data can be programmed into the EEPROM in RS-232C format via the SP/MIC jack.

In this mode the PTT line operate as TXD and RXD data lines respectively.

**Fig. 1****5. Clone Mode****5-1. Outline**

"Clone Mode" copies the transceiver data to another transceiver.

The dealer can copy the transceiver data to another transceiver even without the use of a personal computer.

5-2. Example

The transceiver can copy the programming data to one or more transceivers via RF communication.

The clone source and clone target/s must be in Clone mode.

5-3. Operation

1. To switch the clone target/s to Clone mode, press and hold the [PTT] and [Side2] keys while turning the transceiver power ON.
2. Wait for 2 seconds. The LED will light orange and the transceiver will announce "Clone".
3. Select a channel table number using Lock (increment channel table) and Scan(decrement channel table) keys.
4. To switch the clone source to Clone mode, press and hold the [PTT] and [Side2] keys while turning the transceiver power ON.
5. Wait for 2 seconds. The LED will light orange and the transceiver will announce "Clone".
6. Select the same channel table number as the clone target/s.
7. Press [PTT] on the clone source to begin data transmission.
When the clone target starts to receive data, the LED will light green.
When the clone source finishes sending data, a "confirmation" tone will sound.
If data transmission fails while cloning, an "error" tone will sound from the target unit.
8. If the cloning fails, no data will be available in the target unit when it is returned to User mode.
9. When the cloning is successful, the target unit's "Scan" function will return to their default values (Scan = OFF).

Notes:

- The dealer can clone data to two or more transceivers by repeating the above procedures.
- If the transceivers Clone Mode is configured as "Disabled", the transceiver cannot enter Clone mode.
- The table shown below will cover the frequency tables used for wireless cloning.
- Clone mode cannot be entered in battery low state.
- A unit cannot be a "Source Unit" if it is unprogrammed. If [PTT] is pressed, an "error" tone will sound.
- Once a unit is set to be the source, it cannot be a target after the data has been transmitted. This protects the data in the source unit.
- If the target unit is cloned successfully, it will return to User Mode.
- If the target unit is not cloned successfully, the led will remain Orange.

REALIGNMENT

- The source Unit and target Unit must be of the same model type and destination in order for Clone to operate.
- Clone mode cannot be accessed if "Super Lock" is activated.
- Electronic interface may cause a failure in data transfer during Wireless Clone, such as when waveforms or electromagnetics are being performed at the workbench.
- Clone mode can be used ONLY by the authorized service personnel.
- The Clone mode setting must be configured as "Disable" before being delivered to the end-user.
- To clone, replace the antenna from both the source transceiver and the target transceiver with a dummy load.
- The transmit output power is automatically set to Low in Clone mode.

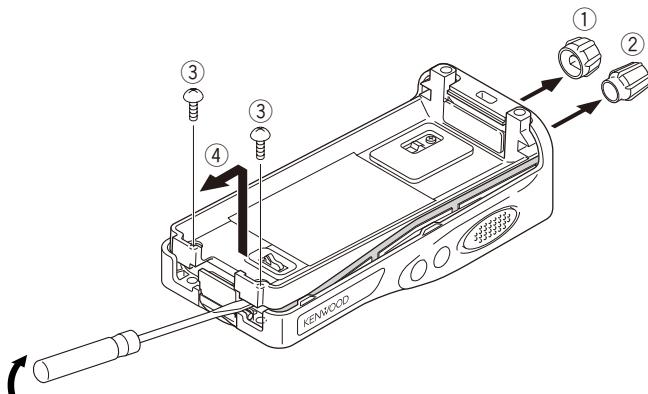

Clone Frequency Table

Table number	Frequency (MHz)
1	463.9750
2	464.1250
3	464.1750
4	464.3250
5	464.3750

DISASSEMBLY FOR REPAIR

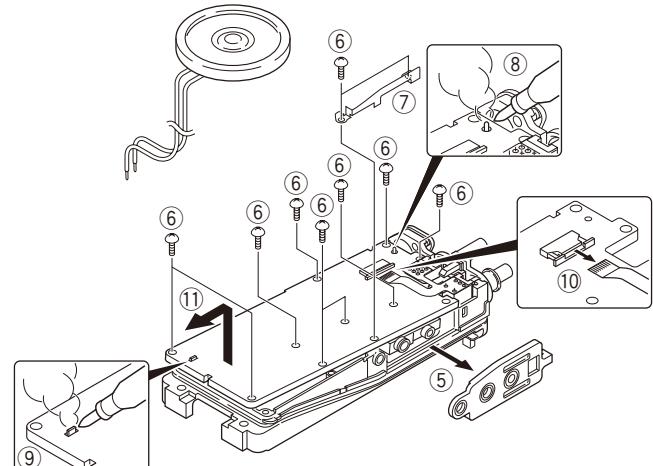

■ Removing the case assembly from the chassis

- Remove the volume knob ① and channel knob ②.
- Remove the two screws ③.
- Lift and remove the chassis from the case assembly ④.
(Use a flat-blade screwdriver to easily lift the chassis.)

■ Removing the TX-RX unit from the chassis

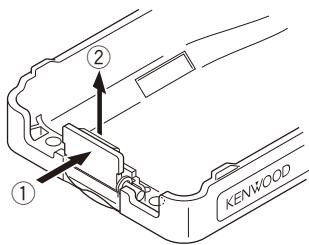

- Remove the packing ⑤ from the SP/MIC jack of the TX-RX unit.
 - Remove the eleven screws ⑥ fixing the TX-RX unit.
 - Remove the fixing bracket ⑦ of the SP/MIC.
 - Remove the solder of the antenna terminal with a soldering iron ⑧.
 - Remove the solder of the positive terminal with a soldering iron ⑨.
 - Remove the FPC from the flat cable connector ⑩.
 - Lift and remove the TX-RX unit from the chassis ⑪.
- Note:** You can remove the TX-RX unit from the chassis without removing the solder at the positive terminal. However, in this case, you can not attach the packing (G53-1605-03) that is on the positive terminal to the chassis in assembling. So, it is advisable to remove the solder on the positive terminal first.

DISASSEMBLY FOR REPAIR

■ Removing the battery release lever from the case assembly

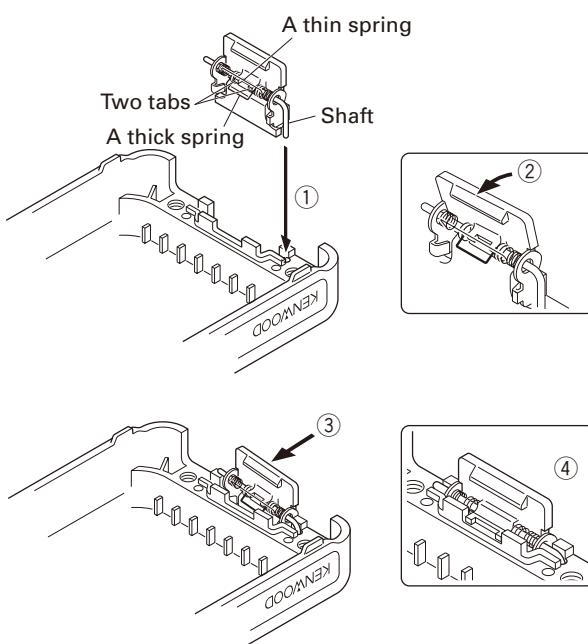

1. Press the upper part of the lever toward the inside of the case assembly. One side of the shaft will be removed ①.
2. Lift and remove the battery release lever from the case assembly ②.

**■ Attaching the battery release lever to the case assembly**

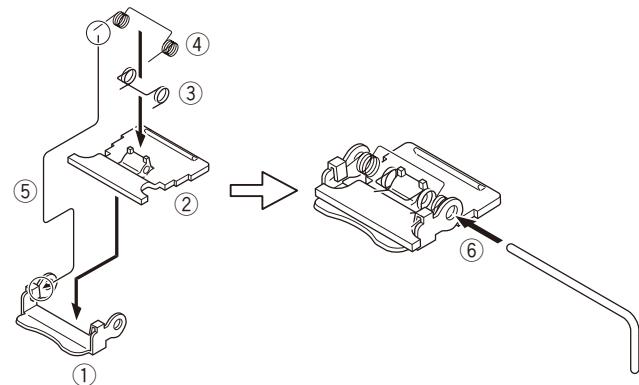

1. Insert one side of the shaft into the hole at the lever fitting section on the case assembly ①.
- Caution:** The thin spring (G01-4543-14) should be positioned above the two tabs of the lever.
2. Tilt the battery release lever slightly forward ②, so that the thick spring (G01-4542-04) is positioned below the case surface.
3. With the thick spring positioned below the case surface, attach the other side of the shaft to the case assembly by pressing the battery release lever ③ until it snaps into place ④.

Caution: Be careful not to tilt the battery release lever too forward.

If the battery release lever is pushed in this state where the two tabs come below the case surface, there is a possibility of damaging the two tabs.

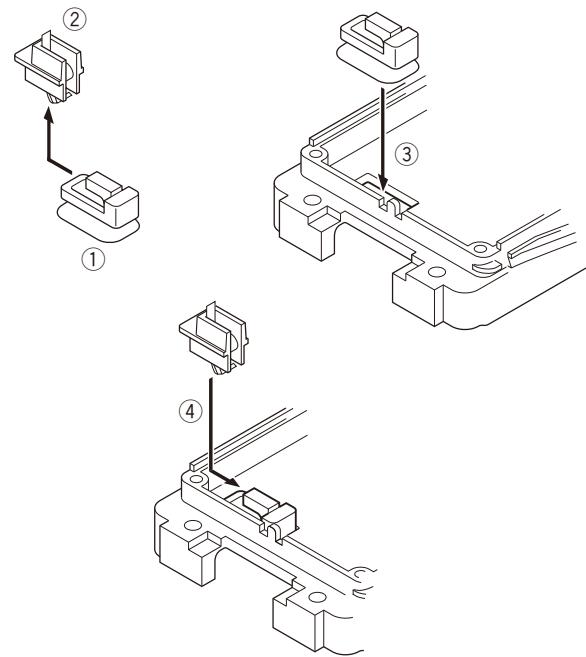

**■ Assembling the battery release lever**

1. Place the lever ② onto the stopper ①.
2. Place the thick spring ③ onto the lever.
3. Hook the right and left ends of the thin spring ④ onto the tabs of the stopper, then place the thin spring onto the lever ⑤.
4. Slide the shaft through the hole of the stopper and lever ⑥.

**■ Cautions for assembly****1. Attaching the positive terminal to the chassis**

Always attach the positive terminal to the chassis, using the following procedures, before mounting the TX-RX unit onto the chassis.

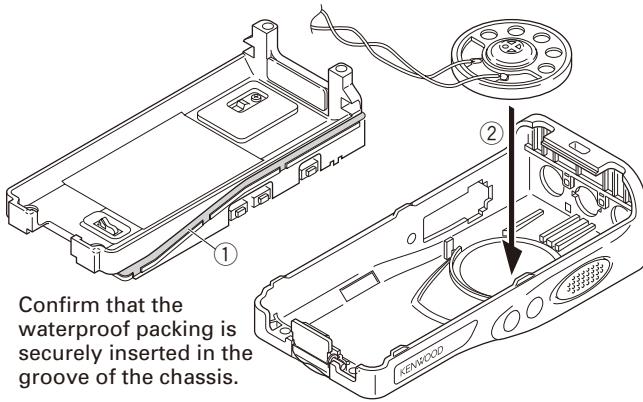

1. Remove the holder assembly ② from the packing ① of the positive terminal.
2. Mount the packing of the positive terminal into the chassis hole ③.
3. Mount the holder assembly into the packing of the positive terminal ④.

DISASSEMBLY FOR REPAIR

2. Mounting the chassis to the case assembly

1. Confirm that the waterproof packing attached to the circumference of the chassis is securely inserted in the groove of the chassis ①.
2. Attach the speaker to the speaker recess of the case assembly ②. Make sure the speaker is securely inserted.

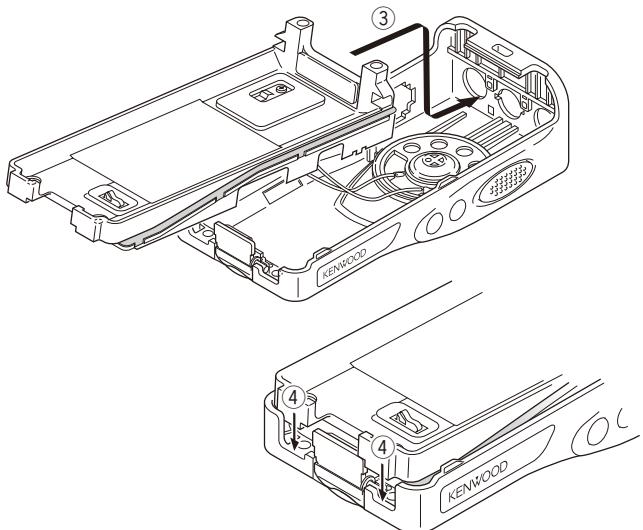

3. Insert the upper part of the chassis into the case assembly ③.

Caution: Take care that the speaker lead wire is not caught by the microphone element.

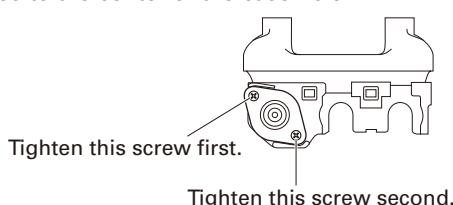

4. Press the chassis ④ and the case assembly together to attach them.

Caution: If the packing of the SP/MIC does not come to the correct position after attaching the chassis to the case assembly, reposition the packing with your fingers.

3. Attaching the antenna receptacle to the chassis

Screw the antenna receptacle to the chassis in the order shown in the drawing so that the antenna receptacle comes to the center of the case hole.

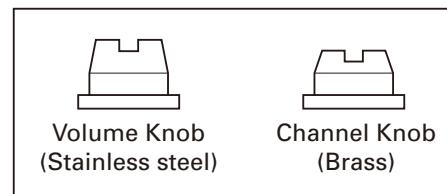

4. The nuts of the volume knob and channel knob

Note that the shapes, colors and heights of nuts of the volume knob and channel knob are different from one another. (The nut of volume knob is stainless steel, and the nut of channel knob is brass)

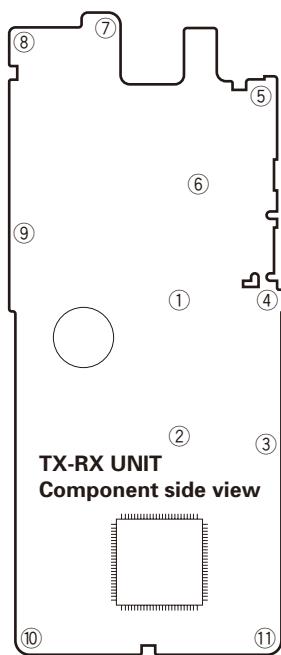

Use the following jig when removing the nuts of the volume knob and channel knob.

- Jig (Part No. : W05-1012-00)

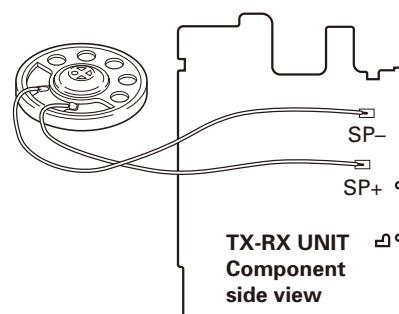

5. Screw sequence for mounting the TX-RX unit to the chassis

Attach the TX-RX unit to the chassis using the screws in the order shown in the drawing below.

6. Connecting the speaker wires to the TX-RX unit

Note: To connect the speaker wires, you must solder it to the location of the TX-RX unit as illustrated below.

CIRCUIT DESCRIPTION

1. Frequency Configuration

The receiver utilizes double conversion. The first IF is 38.85MHz and the second IF is 450kHz. The first local oscillator signal is supplied from the PLL circuit.

The PLL circuit in the transmitter generates the necessary frequencies. Fig. 1 shows the frequencies.

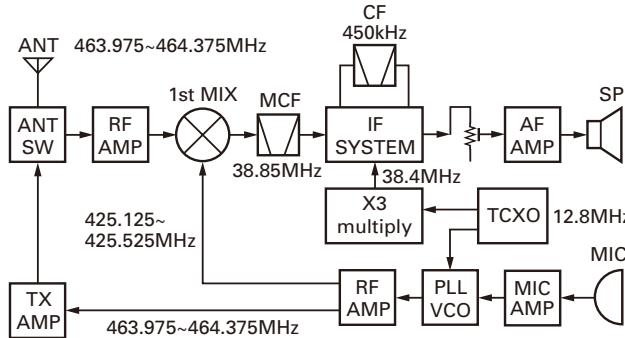

Fig. 1 Frequency configuration

2. Receiver

The frequency configuration of the receiver is shown in Fig. 2.

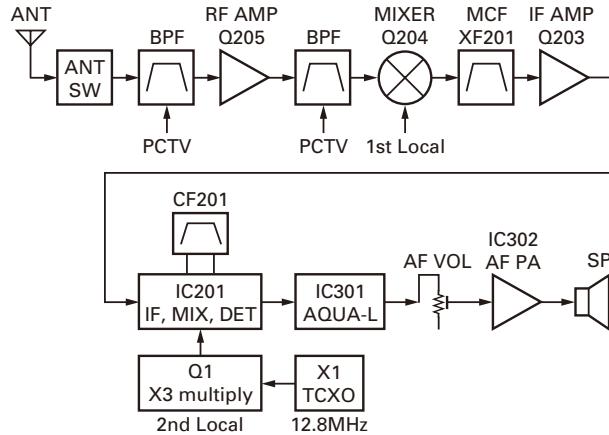

Fig. 2 Receiver section

■ Front End (RF AMP)

The signal coming from the antenna passes through the transmit/receive switching diode circuit, (D103, D104, D106 and D122) passes through a BPF (L229 and L228), and is amplified by the RF amplifier (Q205).

The resulting signal passes through a BPF (L214, L212 and L211) and goes to the mixer (Q204). These BPFs are adjusted by variable capacitors (D203, D204, D205, D206 and D210). The input voltage to the variable capacitor is regulated by voltage output from the micro control unit (MCU) (IC405).

■ First Mixer

The signal from the front end is mixed with the first local oscillator signal generated in the PLL circuit by Q3 to produce a first IF frequency of 38.85MHz.

The resulting signal passes through the XF201 MCF to cut the adjacent spurious and provide the optimum characteristics, such as adjacent frequency selectivity.

■ IF Amplifier Circuit

The first IF signal is passed through a four-pole monolithic crystal filter (XF201) to remove the adjacent channel signal.

The filtered first IF signal is amplified by the first IF amplifier (Q203) and then applied to the IF system IC (IC201). The IF system IC provides a second mixer, second local oscillator, limiting amplifier, quadrature detector and RSSI (Received Signal Strength Indicator). The second mixer mixes the first IF signal with the 38.4MHz of the second local oscillator output (Q1) and produces the second IF signal of 450kHz.

The second IF signal is passed through the ceramic filter (CF201) to remove the adjacent channel signal. The filtered second IF signal is amplified by the limiting amplifier and demodulated by the quadrature detector with the ceramic discriminator (CD201). The demodulated signal is routed to the audio circuit.

■ Audio Amplifier Circuit

The demodulated signal from IC201 goes to AF amplifier through IC301.

The signal then goes through an AF volume control, and is routed to an audio power amplifier (IC302) where it is amplified and output to the speaker.

■ Squelch

Part of the AF signal from the IC enters the FM IC (IC201) again, and the noise component is amplified and rectified by a filter and an amplifier to produce a DC voltage corresponding to the noise level.

The DC signal from the FM IC goes to the analog port of the MCU (IC405). IC405 determines whether to output sounds from the speaker by checking whether the input voltage is higher or lower than the preset value.

To output sounds from the speaker, IC405 sends a high signal to the SP MUTE line and turns IC302 on through Q303, Q304, Q305, Q306 and Q316. (See Fig. 3)

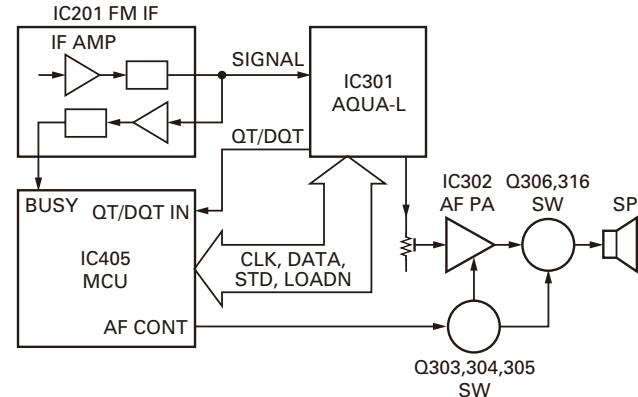

Fig. 3 AF amplifier and squelch

CIRCUIT DESCRIPTION

■ Receive Signaling

• QT/DQT

The output signal from FM IC (IC201) enters the MCU (IC405) through IC301. IC405 determines whether the QT or DQT matches the preset value, and controls the SP MUTE and the speaker output sounds according to the squelch results.

3. PLL Frequency Synthesizer

The PLL circuit generates the first local oscillator signal for reception and the RF signal for transmission.

■ PLL

The frequency step of the PLL circuit is 5 or 6.25kHz.

A 12.8MHz reference oscillator signal is divided at IC1 by a fixed counter to produce oscillator (VCO) output signal which is buffer amplified by Q2 then divided in IC1 by a programmable counter. The divided signal is compared in phase with the 5 or 6.25kHz reference signal from the phase comparator in IC1. The output signal from the phase comparator is filtered through a low-pass filter and passed to the VCO to control the oscillator frequency. (See Fig. 4)

■ VCO

The operating frequency is generated by Q4 in transmit mode and Q3 in receive mode. The oscillator frequency is controlled by applying the VCO control voltage, obtained from the phase comparator, to the varactor diodes (D2, D4, D6 and D7 in transmit mode and D3, D5, D8 and D9 in receive mode). The RX pin is set high in receive mode causing Q5 turn on.

The TX pin is set high in transmit mode. The outputs from Q3 and Q4 are amplified by Q6 and sent to the RF amplifiers.

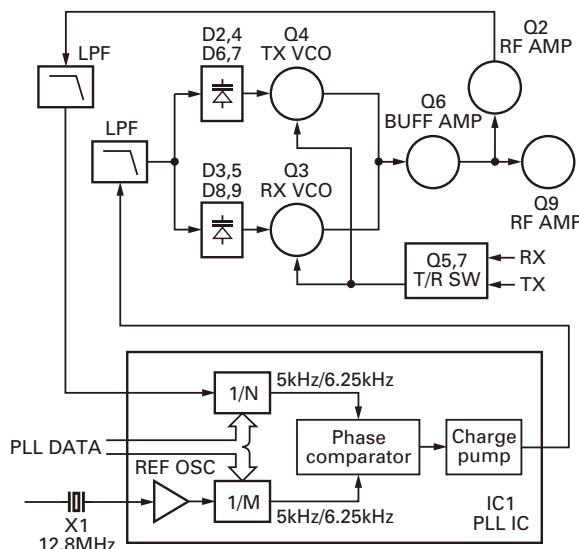

Fig. 4 PLL circuit

■ Unlock Detector

If a pulse signal appears at the LD pin of IC1, an unlock condition occurs, and the DC voltage obtained from C4, R5, and D1 causes the voltage applied to the MCU (IC405) to go low. When the MCU detects this condition, the transmitter is disabled, ignoring the push-to-talk switch input signal.

4. Transmitter System

■ Microphone Amplifier

The signal from the microphone passes through IC301.

The signal passes through the Audio processor (IC301) for the maximum deviation adjustment, and goes to the VCO modulation input.

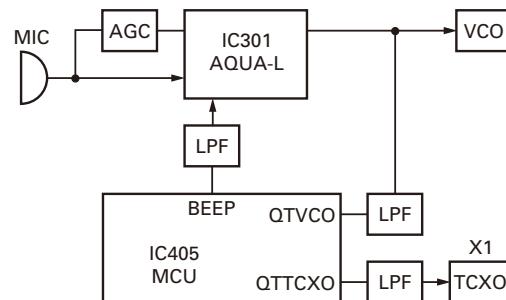

Fig. 5 Microphone amplifier

■ Drive and Final Amplifier

The signal from the T/R switch (D101) is amplified by the pre-drive (Q101) to 50mW.

The output of the drive amplifier is amplified by the RF power amplifier (Q102 and Q103) to 2W (1W when the power is low). The RF power amplifier consists of two MOS FET stages. The output of the RF power amplifier is then passed through the harmonic filter (LPF) and antenna switch (D103 and D122) and applied to the antenna terminal.

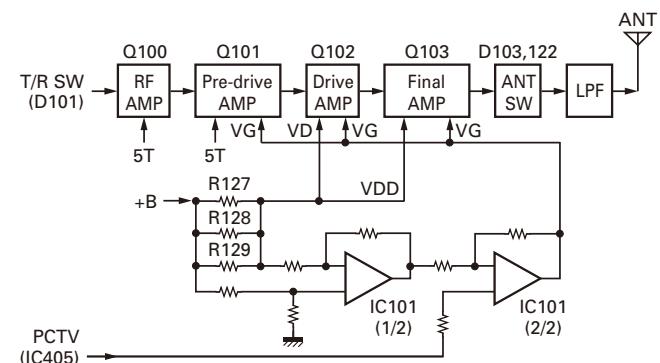

Fig. 6 Drive and final amplifier and APC circuit

■ APC Circuit

The APC circuit always monitors the current flowing through the RF power amplifier (Q102 and Q103) and keeps a constant current. The voltage drop at R127, R128 and R129 is caused by the current flowing through the RF power amplifier and this voltage is applied to the differential amplifier IC101 (1/2).

CIRCUIT DESCRIPTION

IC101 (2/2) compares the output voltage of IC101 (1/2) with the reference voltage from MCU (IC405). The output of IC101 (2/2) controls the VG of the RF power amplifier, Drive amplifier and Pre-Drive amplifier to make both voltages the same.

The change of power high/low is carried out by the change of the reference voltage.

■ Encode Signaling

• QT/DQT

QT,DQT data of the QTTCXO Line is output from pin 28 of the MCU (IC405). The signal passes through a low-pass CR filter and goes to the TCXO (X1).

The QT,DQT data of the QTVCO Line is output from pin 24 of the MCU. The signal passes through a low pass CR filter, mixes with the audio signal, and goes to the VCO modulation input. TX deviation is adjusted by the MCU.

5. Power Supply

There are four 5V power supplies 5M, 5C, 5R, and 5T. 5M for MCU (IC405) is always output while the power is on.

5M is always output, but turns off when the power is turned off to prevent malfunction of the MCU.

5C is a common 5V and is output when SAVE is not set to OFF.

5R is 5V for reception and output during reception.

5T is 5V for transmission and output during transmission.

6. Control Circuit

The control circuit consists of a MCU (IC405) and its peripheral circuits. It controls the TX-RX unit. IC405 mainly performs the following:

- (1) Switching between transmission and reception by the PTT signal input.
- (2) Reading system, group, frequency, and program data from the memory circuit.
- (3) Sending frequency program data to the PLL.
- (4) Controlling squelch on/off by the DC voltage from the squelch circuit.
- (5) Controlling the audio mute circuit by the decode data input.
- (6) Transmitting tone and encode data.

■ Frequency Shift Circuit

The MCU (IC405) operates at a clock of 7.3728MHz. This oscillator has a circuit that shifts the frequency by BEAT SHIFT SW (Q407, Q408).

A beat sound may be able to be evaded from generation if "Beat Shift" is set to ON when it is generated in the internal spurious transmission modulated sound of a transceiver.

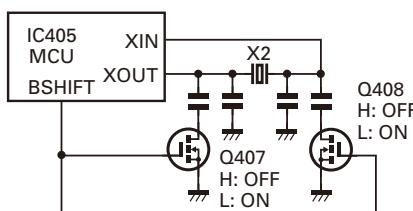

Fig. 7 Frequency shift circuit

■ Memory Circuit

Memory circuit consists of the MCU (IC405) and an EEPROM (IC406). An EEPROM has a capacity of 64k bits that contains the transceiver control program for the MCU and data such as transceiver channels and operating features.

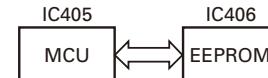

Fig. 8 Memory circuit

■ Low Battery Warning

The battery voltage is checked by the MCU (IC405).

The transceiver generates a warning tone when it falls below the warning voltage shown in the table.

- (1) The red LED blinks when the battery voltage falls below the voltage (1) shown in the table during transmission.

Note:

The transceiver checks the battery voltage during reception even when, in the FPU, the Battery Warning status function is set to "On TX" (default setting).

However, the LED does not blink during reception. During transmission, the LED blinks to generate the warning tone of a low battery voltage.

- (2) The transceiver immediately stops transmission when the battery voltage falls below the voltage (2) shown in the table. A message tone beeps while the PTT switch is released.

	Ni-Cd Battery
(1)	6.2V
(2)	5.9V

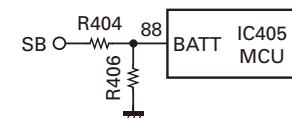

Fig. 9 Low battery warning

7. Control System

Keys and channel selector circuit.

The signal from keys and channel selector input to MCU (IC405) directly as shown in fig. 10.

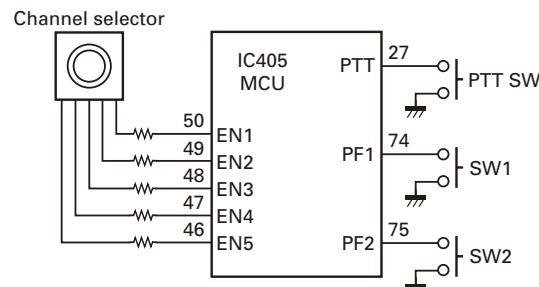

Fig. 10 Control system

Q405	Transistor	5C switch
Q407,408	FET	Beat Shift switch
D1	Diode	Rectification
D2	Variable Capacitance Diode	Frequency control/ TX VCO
D3	Variable Capacitance Diode	Frequency control/ RX VCO
D4	Variable Capacitance Diode	Frequency control/ TX VCO
D5	Variable Capacitance Diode	Frequency control/ RX VCO
D6,7	Variable Capacitance Diode	Frequency control/ TX VCO
D8,9	Variable Capacitance Diode	Frequency control/ RX VCO
D10	Variable Capacitance Diode	Modulator
D11	Diode	Current steering
D101	Diode	TX/RX RF switch
D102	Zener Diode	APC protect
D103,104	Diode	ANT switch
D106	Diode	ANT switch
D122	Diode	ANT switch
D202	Diode	TX/RX RF switch
D203~206	Variable Capacitance Diode	RF BPF tuning
D210	Variable Capacitance Diode	RF BPF tuning
D301,302	Diode	Detector
D303	Diode	Isolation
D401	Diode	Reverse current protection
D402	Diode	Reverse Protection
D403	LED	LED/ Red
D404	LED	LED/ Green
D405	Zener Diode	Limiter

TERMINAL FUNCTION

CN401

Pin No.	Name	I/O	Function
1	B	I	B (Battery Voltage)
2	SB	O	Switched B
3	SP1	I	Audio input
4	SP2	O	Audio output
5	GND	-	GND

Pin No.	Name	I/O	Function
6	EN1	I	Channel selector pulse input
7	EN2	I	Channel selector pulse input
8	GND	-	GND
9	EN3	I	Channel selector pulse input
10	EN4	I	Channel selector pulse input
11	EN5	I	Channel selector pulse input

PACKING

Parts with the exploded numbers larger than 700 are not supplied.

ADJUSTMENT

Test Equipment Required for Alignment

Test Equipment	Major Specifications	
1. Standard Signal Generator (SSG)	Frequency Range Modulation Output	450 to 470MHz Frequency modulation and external modulation -127dBm/0.1µV to greater than -47dBm/1mV
2. Power Meter	Input Impedance Operation Frequency Measurement Capability	50Ω 450 to 470MHz or more Vicinity of 10W
3. Deviation Meter	Frequency Range	450 to 470MHz
4. Digital Volt Meter (DVM)	Measuring Range Input Impedance	10mV to 10V DC High input impedance for minimum circuit loading
5. Oscilloscope		DC through 30MHz
6. High Sensitivity Frequency Counter	Frequency Range Frequency Stability	10Hz to 1000MHz 0.2ppm or less
7. Ammeter		5A
8. AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 10kHz 1mV to 10V
9. Audio Generator (AG)	Frequency Range Output	50Hz to 5kHz or more 0 to 1V
10. Distortion Meter	Capability Input Level	3% or less at 1kHz 50mV to 10Vrms
11. Spectrum Analyzer	Measuring Range	DC to 1GHz or more
12. Tracking Generator	Center Frequency Output Voltage	50kHz to 600MHz 100mV or more
13. 8Ω Dummy Load		Approx. 8Ω, 3W
14. Regulated Power Supply		5V to 10V, approx. 3A Useful if ammeter equipped

The following parts are required for adjustment

1. Antenna connector adapter

The antenna connector of this radio uses an SMA terminal.

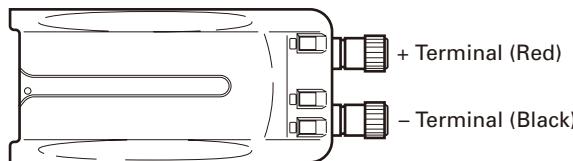

Use an antenna connector adapter [SMA(f) – BNC(f) or SMA(f) – N(f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

2. Repair Jig (Chassis)

Use jig (part No.: A10-4086-03) for repairing the TK-361SA. Place the TX-RX unit on the jig and fit it with screws.

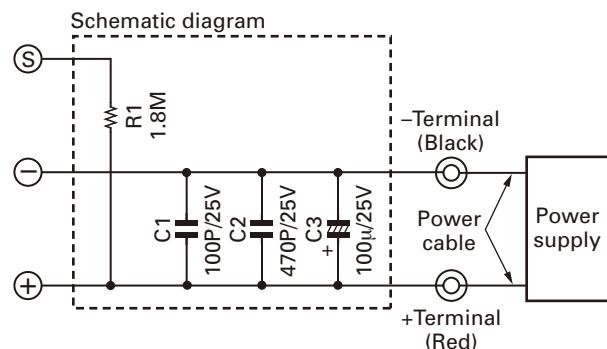

The jig facilitates the voltage check and protects the final amplifier FET when the voltage on the flow side of the TX-RX unit is checked during repairs.

3. Battery Jig (W05-1011-00)

Connect the power cable properly between the battery jig installed in the transceiver and the power supply, and be sure output voltage and the power supply polarity prior to switching the power supply ON, otherwise over voltage and reverse connection may damage the transceiver, or the power supply or both.

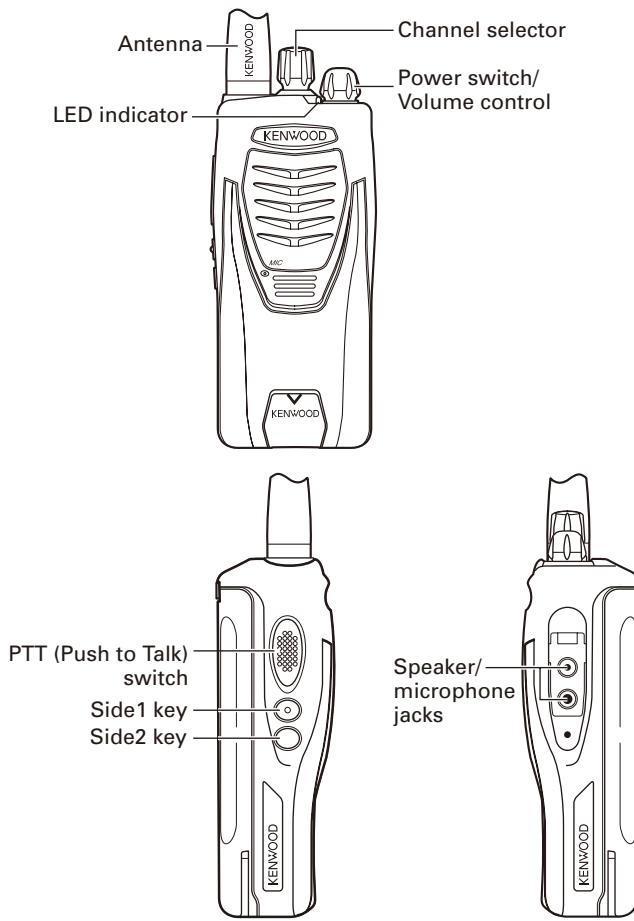

Note: When using the battery jig, you must measure the voltage at the terminals of the battery jig. Otherwise, a slight voltage drop may occur within the power cable, between the power supply and the battery jig, especially while the transceiver transmits.

TK-361SA

ADJUSTMENT

Controls

Frequency and signaling

The set has been adjusted for the frequencies shown in the following table. When required, re-adjust them following the adjustment procedure to obtain the frequencies you want in actual operation.

■ Frequency (MHz)

Channel No.	RX Frequency	TX Frequency
1	460.050	460.100
2	450.050	450.100
3	469.950	469.900
4	460.000	460.000
5	460.200	460.200
6	460.400	460.400

■ Signaling

Signaling No.	RX	TX
1	None	None
2	None	100Hz square wave
3	QT 67.0Hz	QT 67.0Hz
4	QT 151.4Hz	QT 151.4Hz
5	QT 250.3Hz	QT 250.3Hz
6	DQT D023N	DQT D023N
7	DQT D754I	DQT D754I

Preparations for tuning the transceiver

Before attempting to tune the transceiver, connect the unit to a suitable power supply.

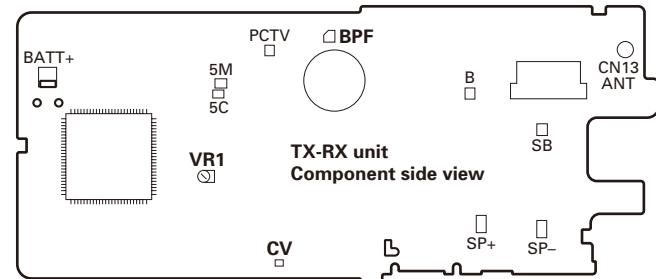

Whenever the transmitter is tuned, the unit must be connected to a suitable dummy load (i.e. power meter).

The speaker output connector must be terminated with a 8Ω dummy load and connected to an AC voltmeter and an audio distortion meter or a SINAD measurement meter at all times during tuning.

■ Adjustment Frequency (MHz)

Test CH	RX Frequency	TX Frequency
Low	450.050	450.100
Low'	455.050	455.100
Center	460.050	460.100
High'	465.050	465.100
High	469.950	469.900

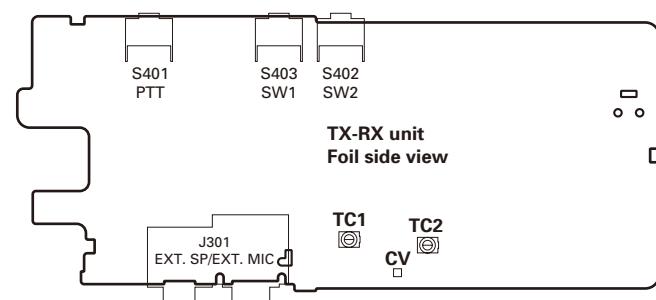

Adjustment Points

VR1 : Frequency adjustment

BPF : Band-pass wave form test point

CV : VCO lock voltage adjustment terminal

TC1 : Transmit VCO lock voltage adjustment

TC2 : Receive VCO lock voltage adjustment

CV : VCO lock voltage adjustment terminal

ADJUSTMENT**Common Section**

Item	Condition	Measurement			Adjustment			Specifications / Remarks
		Test-equipment	Unit	Terminal	Unit	Parts	Method	
1. Setting	1) BATT terminal voltage: 7.5V 2) SSG standard modulation MOD: 1kHz, DEV: 1.5kHz							
2. VCO lock voltage RX	1) CH: High	Power meter DVM	TX-RX	ANT	TX-RX	TC2	2.3V	±0.1V
	2) CH: Low			CV			Check	0.6V or more
3. VCO lock voltage TX	1) CH: High PTT: ON				TX-RX	TC1	2.3V	±0.1V
	2) CH: Low PTT: ON						Check	0.6V or more

5. Battery Warning Level	1) BATT terminal voltage: 5.9V	DVM	TX-RX	ANT BATT terminal			Write	BATT terminal voltage: 5.9V

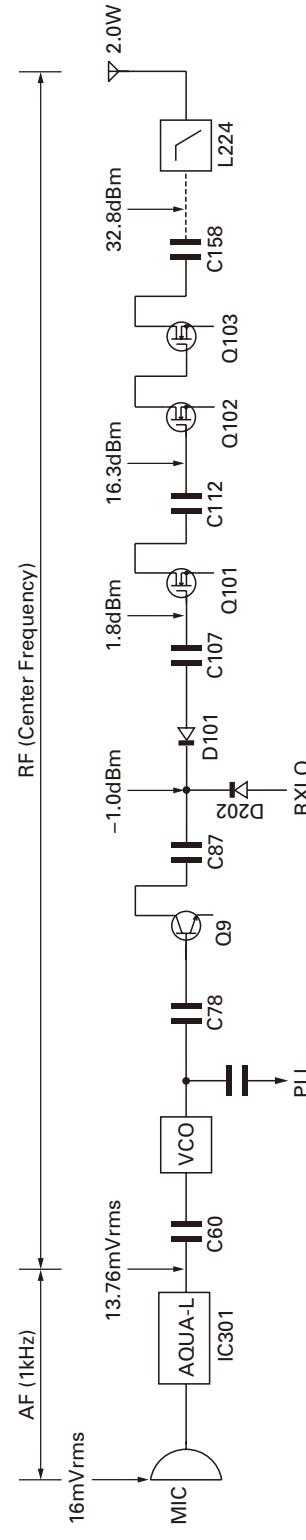

LEVEL DIAGRAM

Receiver Section

To make measurements in the AF section, connect the AC voltmeter. (ANT input: -53dBm, 1kHz FM, 1.5kHz DEV)
In the RF section, use 1000pF coupling capacitor. (The display shows the SSG input value required to obtain 12dB SINAD without Local Level.)

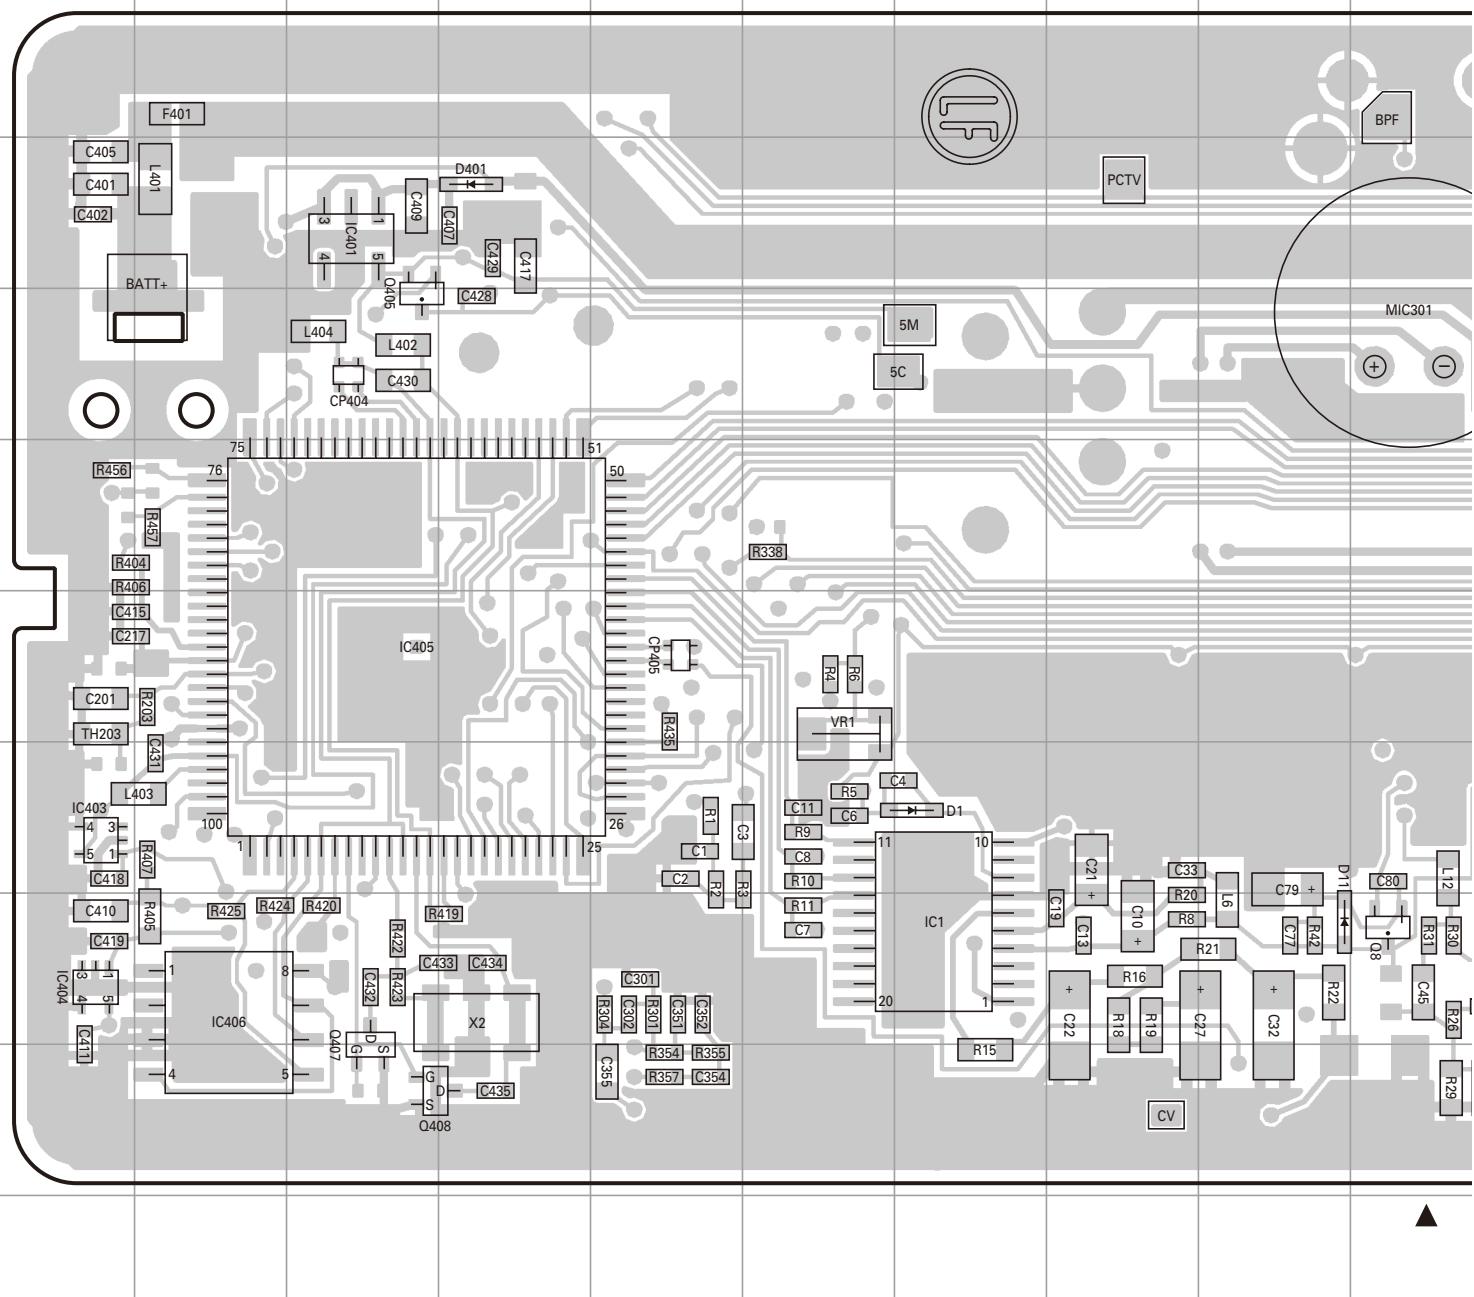

Transmitter Section

AG is set to the MIC Input becomes 1.5kHz DEV at 1.5kHz MOD.
To make measurements in the AF section, connect the AC level meter.
In the RF section, use 1000pF coupling capacitor.
