GENERAL / SYSTEM SET-UP

INTRODUCTION

SCOPE OF THIS MANUAL

This manual is intended for use by experienced technicians familiar with similar types of commercial grade communications equipment. It contains all required service information for the equipment and is current as of the publication data. Changes which may occur after publication are covered by either Service Bulletins or Manual Revisions. These are issued as required.

ORDERING REPLACEMENT PARTS

When ordering replacement parts or equipment information, the full part identification number should be included. This applies to all parts : components, kits, or chassis. If the part number is not known, include the chassis or kit number of which it is a part, and a sufficient description of the required component for proper identification.

PERSONNEL SAFETY

The following precautions are recommended for personnel safety :
- DO NOT transmit until all RF connectors are verified secure and any open connectors are properly terminated.
- SHUT OFF and DO NOT operate this equipment near electrical blasting caps or in an explosive atmosphere.
- This equipment should be serviced by a qualified technician only.

SERVICE

This radio is designed for easy servicing. Refer to the schematic diagrams, printed circuit board views, and alignment procedures contained within.

NOTE

WE CANNOT guarantee oscillator stability when using channel element manufactured by other than KENWOOD or its authorized agents.

FCC COMPLIANCE AND TYPE NUMBERS

Model	Type acceptance number	Frequency range	Compliance
TK-390	ALH21903110	450~490MHz	Parts 22,74,90,95

Model & destination	Unit	X57-540X-XX	X53-378X-XX		Frequency range	Remarks	Charger	Battery	Antenna	Keypad
		0-10	0-12	0-13						
TK-390	K	○	○		450~490MHz	IF1 : 44.85MHz	OP	OP	OP	–
	K4	○		○		LOC : 44.395MHz	OP	OP	OP	○

SYSTEM SET-UP

Frequency range (MHz)	RF power	Type
TX/RX 450~490	4W	TK-390 K,K4

A personal computer (IBM PC or compatible), programming interface (KPG-36), and programming software (KPG-38D) are required for programming.
(The frequency, and signalling data are programmed for the transceiver.)
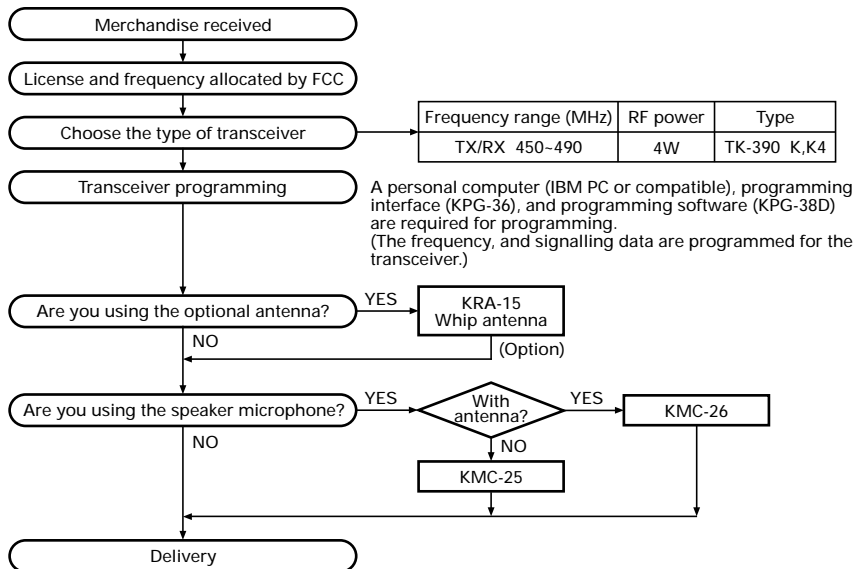

OPERATING FEATURES

1. Getting Acquainted

SMA male type antenna connector

Battery pack release latch

Display

Microphone

Speaker

KENWOOD
1-1. Key Descriptions

① TX/Busy/Battery low indicator

Lights red while transmitting. Lights green while receiving. Flashes red when the battery power is low while transmitting; replace or recharge the battery.

Note : This indicator can be disabled by your dealer.

② Power switch/Volume control

Turn clockwise to switch ON the transceiver. Turn counterclockwise, until a click sounds, to switch OFF the transceiver. Rotate to adjust the volume level.

③ Selector

Rotate this control to activate its programmable function (Page 8).

④ Toggle switch

Switch the toggle position to activate its programmable function (Page 8).

⑤ Top 1
⑥ Top 2
⑦ Orange
⑧ Side 1
⑨ Side 2

Press these PF (programmable function) keys to activate their programmable functions (Page 8)
⑩ PTT (Push-To-Talk) switch

Press this switch, then speak into the microphone to call a station.

⑪ DTMF keypad (keypad models only)

Press the keys on the telephone keypad to send DTMF tones.

⑫ Universal connector

Connect the external speaker/microphone (optional) here. Otherwise, keep the supplied cover in place.

1-2. Display

① Alphanumeric display

Displays the operating group or channel number, or the group or channel name. When making a DTMF or 2 Tone call, the display will alternate between CALL and the channel. Also displays various menu functions.

② 7 Segment display

Displays the operating group or channel number. Also displays tA (Talk Around), P1 (Priority1), P2 (Priority2), or HC (Home Channel); depending on the function being used.

③ A (Add) indicator

Appears when a channel is added to the scanning sequence.

④ SCN (Scan) indicator

Appears when Scan mode is active.

⑤ MON (Monitor) indicator

Appears when the monitor function is active.

⑥ LO (Low) indicator

Appears when low power is selected.

⑦ OPT indicator

Appears when Operator Selectable Tone is enabled.

⑧ AUX (Auxiliary) indicator

Appears when Aux is ON. Appears and blinks when the optional scrambler board is enabled.

Note : The alphanumeric and 7 segment displays can be inverted if a PF key or the toggle switch is programmed with Invert Display (Page 8).

3

OPERATING FEATURES

2. Scan Operating

2-1. Scan Types
• **Single Group Scan**
You can scan all valid (ADD) channels in the displayed group that can be selected with the group selector.

• **Multiple Group Scan**
You can scan all valid (ADD) channels in the all valid (ADD) group.

2-2. Scan Start Condition
One or more non-priority channels must be added to all channels that can be scanned. The transceiver must be in normal receive mode (PTT off).
When you activate the key or the toggle switch (to right position) programmed to the scan function, the scan starts. The scan icon "SCN" lights and "SCAN" or revert channel (programmable) is indicated on 7-digit alphanumeric display.

2-3. Scan Stop Condition
The scan stops temporarily if the following conditions are satisfied.
1) A carrier is detected, then signalling matches on channels for which receive the signalling is set by the programming software.
2) A carrier is detected on the channel for which receiving signalling is not set by the programming software or when the monitor (signalling cancel) function is activated.

2-4. Scan Channel Types
1) Priority channel 1 is the most important channel for the scan, and always detects a signal during scan and when the scan stops temporarily.
2) Priority channel 2 is the next important channel for the scan, and always detects a signal during scan and when the scan stops temporarily at a channel other than priority channel 1.
3) Non-priority channels detects a signal during scan. For the channels that can be selected with the group or channel selector when the scan does not occur, adds an indicator "A" lights.

2-5. Priority Channel Setting
Priority channels 1 or 2 can be set as follows with the programming software (KPG-38D).
1) Specify priority channels 1 or 2 as fixed priority channels.
2) Make selected channels, priority channels.
3) Operator delectable
Specify the initial channel before the operator changes it.

2-6. Scan Type According to the Priority Channel
1) When no priority channels are set : Only the non-priority channels are scanned.
If a non-priority channel stops temporarily, it stops until there is no signal on the channel.

2) When one priority channel is set : Either priority channel 1 or 2 is scanned.
If a non-priority channel stops temporarily, a priority channel signal is detected at certain intervals.
If a priority channel stops temporarily, it stops until there is no signal on the priority channel.
3) When two priority channels are set : The non-priority channel, priority channels 1 and 2 are scanned.
If a non-priority channel stops temporarily, priority channel 1 and 2 signals are detected at certain intervals.
If priority channel 2 stops temporarily, the priority channel 1 signal is detected at certain intervals.
If priority channel 1 stops temporarily, it stops until there is no signal on priority channel 1.

2-7. Revert Channel
The revert channel is used to transmit during scanning and set by the programming software (KPG-38D).
1) Priority 1
The transceiver reverts to the priority channel 1.
2) Priority 1 with talkback
The transceiver reverts to the priority channel 1.
If you press PTT during a resume timer (dropout delay time, TX dwell time) or calling, you can transmit on current channel to answer to the call however revert channel is set to priority channel 1.
After resume time, scan re-starts and transmission channel is return to priority channel 1.
3) Priority 2
The transceiver reverts to the priority channel 2.
4) Priority 2 with talkback
The transceiver reverts to the priority channel 2.
If you press PTT during resume timer (dropout delay time, TX dwell time) or calling, you can transmit on current channel to answer to the call however revert channel is set to priority channel 2.
After resume time, scan re-starts and transmission channel is return to priority channel 2.
5) Selected channel
The transceiver reverts to the channel before scanning or the channel that you changed during scan.
6) Last called channel
The transceiver reverts to the last called channel during the scan.
7) Last used channel
The transceiver reverts to the last used (transmitted) channel during scan. "Last used" revert channel includes talkback function.
8) Selected with talkback
The transceiver reverts to the channel before scanning or the channel that you changed during scan.

2-8. Scan End
When you reactivate the key or the toggle switch (to left position) programmed to the scan function during scan mode, the scan ends.
The scan icon "SCN" and "SCAN" or revert channel (programmable) display goes off.

2-9. Temporarily Delete/Add

It is possible to delete or add channel temporarily during scan. When scan stops on unnecessary channel for example by interference of the other party, activate the delete/add function (for example press the key), then that channel is deleted temporarily and scan re-start immediately.

When you would like to add the deleted channel temporarily to scan sequence, select the desired (deleted) channel during scan, activate the delete/add function (for example press the key) before scan re-start.

That channel is added temporarily to scan sequence. The temporary deleted or added channels are returns to pre-set delete/add, when the transceiver exits from scan mode.

3. Optional Features

You can use these features using the programming software (KPG-38D).

3-1. Alphanumeric Display (Group/Channel Name)

The programming software (KPG-38D) enables you to set the alphanumeric display for group/channel name. The total text size of group and channel name are 7-digits.

For example, If you set 2-digits for group name, then you can use 5-digits for channel name. The characters can be used as shown in Figure 1.

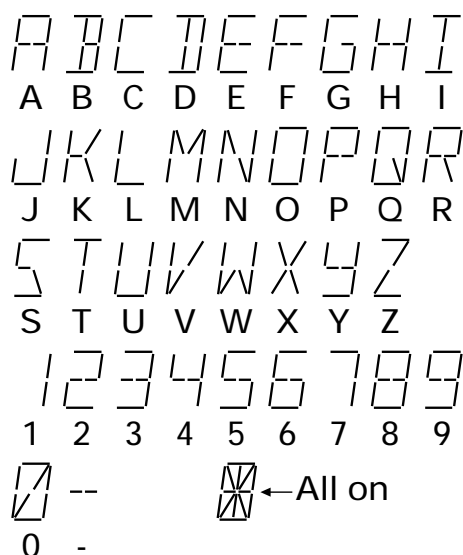

Fig. 1

3-2. Beep Tones

The beep tones (power on tone, control tone, warning tone, alert tone) are individually programmable to the fixed level 0 to 31 or follow the mechanical volume position.

3-3. Minimum Volume

The minimum volume is programmable (0 to 31). The transceiver remains the minimum volume level however the mechanical volume position is set to zero.

3-4. BCL (Busy Channel Lockout) Override

You can transmit in spite of Busy Channel Lockout situation. For example : To make an emergency voice call.

To transmit under busy channel lockout situation, press PTT once more within approx. 500ms after the PTT release.

3-5. Selective Call Alert LED

You can select whether or not the LED on the transceiver flashes in an orange color when Selective call was occurred.

3-6. Battery Warning

This transceiver has battery warning feature. If the low voltage is detected during transmission, the transceiver warns it by flashing red "LED".

Then more low voltage is detected during transmission, the transceiver stops transmission and warns it by flashing red "LED" and beep.

Please notice "standard" for the battery exchange, charging time by flashing red LED and beep.

3-7. Busy LED

You can program the enable or disable the busy "LED" function when a carrier is detected. "Disable" saves battery life.

3-8. TX LED

You can program the enable or disable the transmission "LED" function.

3-9. 2-Digit 7-Segment Display

You can use 2-digit 7-segment the display to display the channel number or group number. It is useful when the main (7-digit 13-segment) display indicates group or channel name.

3-10. Invert Display

Main (7-digit 13-segment) display and sub (2-digit 7-segment) display can be programmed to invert display.

It is easy to read the display when the operator suspended the transceiver on a waste belt. The operator also can change the display between normal and invert using key. Refer the invert display function of key function.

3-11. Emergency Channel Display

The transceiver can be programmed to display "EMERGENCY" channel name when it is in emergency mode.

If you set to "off" by KPG-38D the transceiver shows selected group/channel/status before entering to the emergency mode however the transceiver is in an emergency mode.

3-12. Clear to Transpond

The transceiver waits the transpond of 2-Tone/DTMF if channel is busy until channel open. This feature prevents the interference to other party.

3-13. External Speaker

It can be selected if the receive sound is made by SP-Mic SP or the main body SP at a SP-Mic mount.

OPERATING FEATURES

3-14. Mode (Enable/Disable)

The transceiver has many special modes mainly for maintenance.

· Self Programming mode
· Panel Test mode
· Clone mode
· Firmware Programming mode

It is possible to set enable/disable for each mode. We recommend to set these mode to Disable after set up to save contents.

3-15. ID

The transceiver is capable to have ID. The format is DTMF. The timing that the transceiver sends ID is programmable.

Connect ID : Connect ID is send on beginning of transmission.

Disconnect ID : Disconnect ID is send on end of transmission.

Both : Connect ID is send on beginning of transmission and disconnect ID is send on end of transmission.

Off : Sending ID function is disabled.

There is also "PTT ID" setting for each channel. Refer "PTT ID" of channel feature.

3-16. OST (Operator Selectable Tone)

The transceiver is capable to have "OST" function and 16 tone pair (QT/DQT) with max 7-digit name for each tone pair.

• "OST" Back Up

The transceiver is programmable the selected "OST" code is memorized or not. If you set to Disable (no memorized), the "OST" function always starts at "off".

• Direct "OST"

It is possible to call "OST" number directory using keypad. In this case, keypad is used for "OST", then "DTMF Auto PTT" "DTMF Auto Dial" functions by keypad are not usable.

3-17. Radio Password (Keypad Model Only)

The radio password prevent unauthorized users operation. Every time the power on, transceiver is locked and unusable until entering correct password.

Enter pre-programmed password by FPU and [#] key causes the transceiver unlocked.

3-18. Data Password (Keypad Model Only)

The data password prevents unauthorized reading of the programmed transceiver data by FPU. Enter pre-programmed password in FPU reading process. This password also protects the clone.

Enter pre-programmed password by FPU and [#] key to clone.

4. Group Features

You can use these features using the programming software (KPG-38D).

4-1. "TOT" (Time-Out Timer)

The transceiver has the "TOT". This parameter selects the period of time users can continuously transmit.

When the selected period passes, the transceiver generates an warning tone and stops the transmission.

4-2. "TOT" Pre-Alert

The transceiver has "TOT" pre-alert timer. This parameter selects the time at which the transceiver generates "TOT" pre-alert tone before "TOT" is expired.

"TOT" will be expired when the selected time passes from a TOT pre-alert tone.

4-3. "TOT" Re-Key Time

The transceiver has "TOT" re-key timer. This timer is the time you can not transmit after "TOT" exceeded. After "TOT" re-key time expired you can transmit again.

4-4. "TOT" Reset Time

The transceiver has "TOT" reset timer. This timer is the minimum wait time allowed during a transmission that will reset the "TOT" count.

"TOT" reset time causes the "TOT" to continue even after PTT is released unless the "TOT" reset timer has expired.

4-5. Group Delete/Add

The transceiver can set the delete/add in each group. If "Delete" is selected, the transceiver does not scan the deleted group in multi group scan.

4-6. Battery Save

This is the automatic battery saver during a standby mode operation. The receiver circuit is repeated on and off to conserve the battery life.

4-7. Signalling

Signalling "AND/OR" sets the audio unmute condition for any channel programmed with the option signalling (2-Tone/DTMF).

AND : "AND" requires both the valid option signalling and the programmed QT/DQT to be received for audio to unmute (and initiate an option signalling decode alert).

OR : "OR" requires either the valid option signalling or the programmed QT/DQT to be received for audio to unmute (an option signalling decode alert is only initiated if the proper option signalling is decoded).

OPERATING FEATURES

5. Channel Features

You can use these features using the programming software (KPG-38D).

5-1. Option Signalling

The transceiver is programmable to the option signalling (2-Tone decode program 1, 2-Tone decode program 2, 2-Tone decode program 3, DTMF decode) to each channel. It is useful to receive an individual call.

Receive format is selectable "AND" or "OR" with QT/DQT for each group. The radio response of option signalling is programmable "(Call) Alert tone" or "Transpond" for each option signalling (2-Tone decode program 1, 2-Tone decode program 2, 2-Tone decode program 3, DTMF).

5-2. PTT ID

PTT ID provides a DTMF ANI to be sent with every time PTT (connect ID at beginning of transmission, disconnect ID at end of transmission, or both).

You can program PTT ID "on" or "off" for each channel. The contents of ID are programmed for each transceiver.

5-3. Busy Channel Lockout

Transmission is inhibited when the channel is busy. It is able to set this feature "Yes" or "No" for each channel.

5-4. Beat Shift

This is the feature that the microprocessor shifts its system clock frequency slightly to prevent the receive interference. This transceiver can program this feature "Yes" or "No" for each channel.

5-5. TX Power

You can set the transmission power "High" or "Low" for each channel. The each power setting is tuned at factory.

However, you can re-tune the power, using PC Tuning Mode of KPG-38D.

5-6. Wide/Narrow

You can set the occupied band width mode "Wide" or "Narrow" for each channel. It is useful for the operator to use the transceiver on various sites.

5-7. Scan Delete/Add

Scanning "delete/add" is programmable for each channel. Set the currently selected channel required to include in the scan sequence to "add".

The operator can change the "delete/add" information using the key programmed to "delete/add" function.

6. Key Functions

You can use these features, using the programming software (KPG-38D). Selector function is selectable channel select or group select.

The functions for Toggle switch are listed page 8 (Fig. 2). Right position is active for programmed function on toggle switch except "group select".

The functions for the top key are listed page 8 (Fig.2). Hold action and shift action are programmable.

The functions for side key are listed page 8 (Fig.2). Hold action and shift action are programmable.

The functions for microphone key are listed page 8 (Fig.2). Hold action is programmable.

6-1. No Function

Sounds error operation beep, and no action will occur. Use this function when the transceiver is required to be more simple operated.

6-2. AUX.

This function can be programmed when the voice scrambler board is not installed.

If this key is pressed, "AUX" icon lights on the LCD and AUX port which is inside of the transceiver turns to the high level. If pressed again, the "AUX" icon goes off and the AUX ports turns to the lower level.

6-3. Channel Down

If this key is pressed once, the channel number decreases by one step. If this key holds down for 500ms (approximate), the channel number decreases continuously.

This key works as the squelch level adjuster in a squelch level adjust mode. This key works as the OST (operator selectable tone) number selector in the OST mode. This key works as the SCR (voice scrambler) code selector in the voice scrambler code select mode.

6-4. Channel Up

If this key is pressed once, the channel number increases by one step. If this key holds down for 500ms (approximate), channel number increases continuously.

This key works as the squelch level adjuster in squelch level adjust mode. This key works as the OST (operator selectable tone) number selector in the OST mode. This key works as the SCR (voice scrambler) code selector in the voice scrambler code select mode.

6-5. Channel Name

This key switches the LCD display between the group/channel number and the group/channel name.

6-6. Delete/Add

This key switches the currently displayed channel between "Delete" and "Add".

The "Add" channel contained in the scan sequence, and "Delete" channel is not contained. In the scan mode, this key switches the channel delete or add temporarily.

OPERATING FEATURES

1   This function can be selected when the scrambler board has not been installed.
2   This function can be selected when the ANI board has been installed.
3   This function can be selected when the scrambler board has been installed.

Note : If "Shift" is pregrammed onto one of the PF keys <u>or</u> the toggle switch, the remaining PF keys can be programmed with two different functions. If "Shift" is programmed onto a PF key <u>and</u> the toggle switch, an error will occur and the function will not operate.

Fig. 2   Programmable functions

6-7. Group Down

If this key is pressed once, the group number decreases by one step. If this key holds down for 500ms (approximate), the group number decreases continuously.

This key works as the squelch level adjuster in squelch level adjust mode. This key works as the OST (operator selectable tone) number selector in the OST mode. This key works as the SCR (voice scrambler) code selector in the voice scrambler code select mode.

6-8. Group Up

If this key is pressed once, the group number increases by one step. If this key holds down for 500ms (approximate), the group number increases continuously.

This key works as the squelch level adjuster in the squelch level adjust mode. This key works as the OST (operator selectable tone) number selector in the OST mode. This key works as the SCR (voice scrambler) code selector in the voice scrambler code select mode.

6-9. Home Channel

Press this key once, the channel switches to the pre-programmed home channel. Press this key again, the channel goes back to the previous channel.

6-10. Invert Display

Press this key once, the displayed the group/channel number or group/channel name are inverted. Press this key again, the display returns to the normal.

For the operator who does not change the display and needs "Invert" only, refer "Invert Display" setting of optional feature.

6-11. Key Lock

Pressing this key causes the transceiver to accept an entry of only the [Shift], [KeyLock], [PTT], [Emergency] keys, [Selector switch], [Volume], [Toggle], [Lamp], [Moni], [Moni momentary], [SQ off] and [SQ momentary].

"Lock" is used to prevent users from unexceptable key press which might cause a transceiver malfunction. The display does not change while the key is being locked.

Switching the transceiver off and on or pressing Key Lock again cancels the key lock. Key locked transceiver can still receive. Pressing this key while scanning, keys are locked but a scanning continues.

6-12. Lamp

Press this key, the transceiver illuminates the display and keypad back lit approximate 5 seconds. Press this key again, the transceiver stops the illuminating.

Pressing any key except the LAMP key while the illuminated restarts the 5 second timer.

6-13. Low Power

Press this key, the transmission power of all channel changes to Low. Press this key again, the transmission power returns to programmed value.

OPERATING FEATURES

6-14. Monitor

Monitor the channel before a transmission.

Press this key once, "MON" appears and unmutes speaker if a carrier is present, regardless of the specified signalling (including option signalling). Press this key again, "MON" disappears and mutes speaker.

Press this key after the Option Signalling is matched, the Option Signaling is reset and monitor is activated. DBD (Dead Beat Disable) mode is not reset by this operation.

6-15. Monitor Momentary

While pressing this key, the monitor function (refer 6-14) is activated. Release this key, the monitor function is de-activated.

6-16. Operator Selectable Tone

This key switches the pre-set decode QT/DQT and en-code QT/DQT to OST (Operator Selectable Tone) tone pair.

Press this key, the transceiver enters to OST select mode. In this mode, the display shows "OFF" and the opera-tor can select one of the OST tone pair using the channel up/down key or the group up/down key. The display shows "TONE ＊＊" and tone pair No. ＊＊ is selected.

Press OST key again, the transceiver exits from the OST select mode, and returns to the group/channel mode with "OPT" icon. "OPT" icon means that the OST tone pair is selected. OST tone pair number or OFF can be memorized for each channel.

16 kinds of tone pair for OST can be programmed by KPG-38D. OST is useful to access the repeater with same radio frequency and different tone (QT/DQT).

6-17. Operator Selectable P1

If priority channel 1 is set as "Fixed" and "None" in the scan information. The operator can select the priority chan-nel 1, using this key (operator selectable fixed P1).

Press this key on normal channel, the channel becomes to priority channel 1. Previous priority channel 1 returns to the normal channel. Press this key on the priority channel 1, the priority 1 will be lost (no priority 1).

6-18. Operator Selectable P2

If priority channel 2 is set as "Fixed" and "None" in the scan information. The operator can select the priority chan-nel 2, using this key (operator selectable fixed P2).

Press this key on the normal channel, the channel be-comes to the priority channel 2. Previous priority channel 2 returns to the normal channel. Press this key on priority channel 2, the priority 2 will be lost (no priority 2).

6-19. Scan

Press this key starts scanning. Pressing this key stops scanning.

6-20. Shift

This key activates "Shift + [Key]" function. It is useful when the numbers or more of the functions are necessary.

6-21. Squelch Level

The preset squelch level is varied in user mode (0 to 15). Press the key programmed to "squelch level", the trans-ceiver enters to "squelch level adjust mode".

The squelch level can be adjusted by group "up/down" function key or channel "up/down" function key. Press the key programmed to "squelch level" again, the adjusted level is memorized and returns to the normal user mode.

6-22. Squelch Momentary

While pressing this key, the transceiver unmutes speaker regardless of an existence of a carrier and "MON" appears and busy "LED" lights on.

Release this key, the transceiver mutes the speaker and "MON" disappears and busy "LED" lights off.

6-23. Squelch Off

Press this key, the transceiver unmutes speaker regard-less of the existence of a carrier and "MON" appears and busy "LED" lights.

Press this key again, the transceiver mutes the speaker and "MON" disappears and busy "LED" lights off.

6-24. Talk Around

Press this key, the transceiver uses the receive fre-quency and the tone for transmission.

The operator can call the other party directory (without repeater). Press this key again, the talk around function goes off.

6-25. Emergency Call

Press this key, the transceiver enters to an emergency mode. In this mode, the channel is switched to the pro-grammed emergency channel automatically and starts transmission with an emergency ID code which is pro-grammed to ANI board.

The display depends on "Emergency Channel Display" setting.

6-26. SP Attenuation

Press this key once, the volume level of speaker-micro-phone is attenuated. Press this key again, the volume level of speaker-microphone returns to the previous level.

7. 2-Tone

Built-in 2-Tone decoder (decoder program 1, decoder pro-gram 2, decoder program 3) is available for option signalling. It is possible to use individual call or group call.

8. DTMF

Built-in DTMF encoder is available for dialing (Manual dial, Auto-dial (9 memory), Re-dial (1 memory)) (Keypad model only). Built-in DTMF decoder is available for option signalling.

It is possible to use individual call, group call, DBD (Dead Beat Disable).

OPERATING FEATURES / REALIGNMENT

9. Data Programming (PC Mode)

9-1. Preparation and Connection

TK-390 transceiver is programmed by using a personal computer, programming interface cable KPG-36, and programming software KPG-38D.

The programming software can be used with an IBM-PC or compatible machine. Figure 3 shows the setup for programming.

9-2. Programming Interface Cable KPG-36 Description

The KPG-36 is required to interface TK-390 to the computer. It has a circuit in its D-sub 25pin connector case that converts RS-232C logic level to TTL level.

KPG-36 is used to connect between TK-390 universal connector and RS-232C serial port of computer.

9-3. Programming Software KPG-38D Description

KPG-38D is the programming software for TK-390 supplied on a 3.5" floppy disk. This software runs under MS-DOS version 3.1 or later on an IBM-PC/XT, AT, or PS2 or compatible machine.

The data can be input to or read from TK-390 and edited on the screen. The programmed or edited data can be printed out. It is also possible to tune the transceiver.

We recommend that install KPG-38D for example to harddisk first then use it.

KPG-38D instruction manual part No. : B62-0814-XX.
Fig. 3

REALIGNMENT

1. Mode
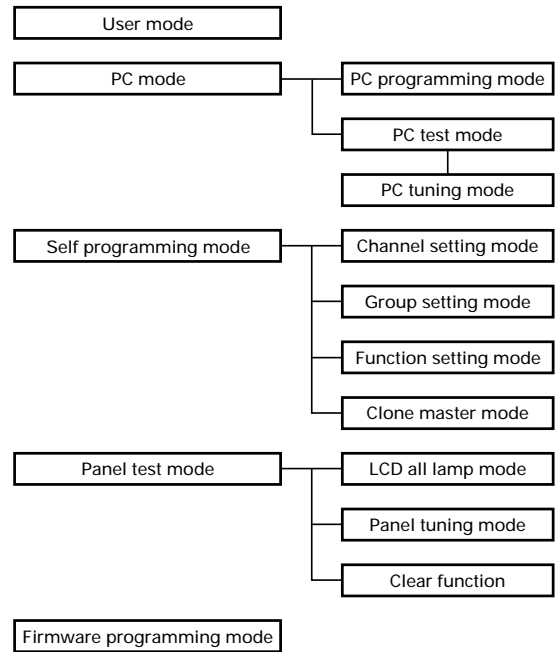

Mode	Function
User mode	Customer use this mode
PC mode	Communication between the radio and PC (IBM compatible). It requires the KPG-38D
PC programming mode	Frequency, signalling and features write to the radio and read from the radio.
PC test mode	Check the radio using the PC. This feature is included in the FPU.
Self programming mode	Frequency, signalling and features write to the radio.
Panel test mode (Refer to Adjustment)	Dealer use to check the fundamental characteristics.
Firmware programming mode	Re-write the firmware of the flash ROM.

2. How to Enter Each Mode

Mode	Operation
User mode	Power on
PC mode	Power on begins the USER MODE.
Self programming mode	Hold down the [Side 1] key and the [Side 2] key, turn the radio power on.
Panel test mode	Hold down the [Side 2] key and [PTT], turn the radio power on, and release [PTT] first.
Firmware programming mode	Held down the [Side 2] key and [PTT], turn the radio power on, and release [Side 2] key first.

REALIGNMENT

3. Self Programming

Write mode for frequency data and signalling etc. Mainly used by the person maintaining the user equipment.

3-1. Enter to the self programming mode

Turn the power switch on, with the lead wire with plug PF (8 pin) shorted to the E (10 pin) lead (Figure 4), or delete R466 (SELF, Figure 5) in the TX-RX unit and turn the power switch on while pressing the [Side 1] and [Side 2] keys.

Note :

This mode (self programming mode) cannot be set when it has been disabled with the FPU.

Lead wire with plug
(E30-3287-08)

2: RED (RX AF OUTPUT)
3: BLACK (RX AF OUTPUT)
5: WHITE (MIC INPUT)
6: BROWN (MIC GND)
7: BLUE (PTT SW) GND → ON
8: YELLOW (PF SW) ⎤
10: BROWN (GND) ⎦ — Shorted
11: GREEN (5M)

Fig. 5

When enter the self programming mode, "FUNC" appears after "SEL" is displayed for half a second.

Selecting any of Channel setting, Group setting, Function setting, or Clone master with the [Top 1] [Top 2] keys and then pressing [PTT] sets the Setting mode for that time.

Key operations in Self programming mode are as follows.

[Selector switch] : Not used
[PTT] : Functions as a RUN or Execute key
[Top 1] : Use as a Down key
[Top 2] : Use as an Up key
[Side 1] : Use for select channel steps in Channel setting mode, or switching for QT/DQT.
[Side 2] : Use as a cancel key
[Orange] : Add or delete frequencies in Channel setting mode
[Toggle] : Flipping this to the right while in Channel setting mode, shifts to MHz steps.

Attach the lead wire with plug
or
[Side 1] + [Side 2] + Power on → "SEL"

"CHAN" [PTT]

"CLONE" [PTT]
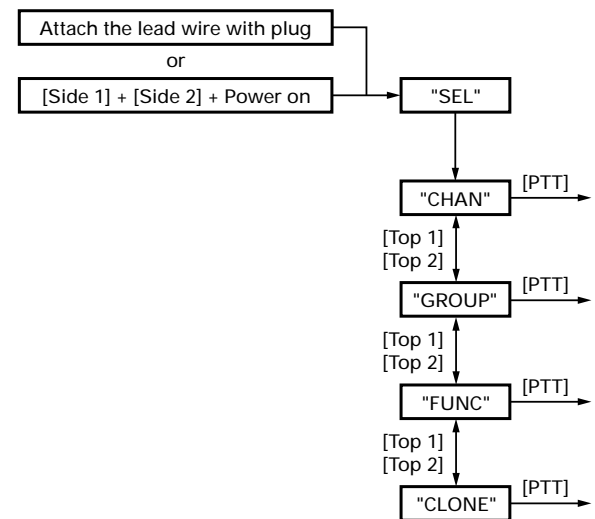

REALIGNMENT

3-2. Channel Setting Mode

Set data for each channel while in this mode. After first entering Self programming mode, select the "CHAN" display with [Top 1] [Top 2] and press [PTT] to set Channel Setting mode. Once in Channel Setting mode, select the group that needs setting with the [Top 1] [Top 2] keys and press [PTT]. Next select the channel for setting with the [Top 1] [Top 2] keys and press [PTT]. The setting items and setting data will then appear so reset the data with the [Top 1] [Top 2] keys and press [PTT]. When finished, the display shifts to the next setting item. After finished setting all items press [PTT] to return to Group selection. Changes in the frequency CH steps and the QT/DQT steps can be made in [Side 1].

No.	Function name	Display	Remarks
	Select Group/Channel	1.–1 during group selection 1–1. during channel selection	1–160~160–1
1	RX frequency	R450.0125	Receive frequency (Dot on right edge is lit up during 6.25kHz steps)
2	RX signalling	RX 023N	Receive QT/DQT (Dot on right edge is lit up during 1 step changes)
3	TX frequency	T450.0125	Transmit frequency (Dot on right edge is lit up during 6.25kHz steps)
4	TX signalling	TX 250.3	Transmit QT/DQT (Dot on right edge is lit up during 1 step changes)
5	Option signalling	2ToneA	OFF, DTMF, 2ToneA, 2ToneB, 2ToneC
6	DEL/ADD	D/A ADD	Delete, Add
7	Wide/Narrow	WIDE	Wide. Narrow
8	PTT ID	ID OFF	OFF, ON
9	TX power	POW HI	High, Low
10	Busy channel lockout	BCL OFF	OFF, ON
11	Beat shift	SFT OFF	OFF, ON

- **Operation**
1. Select the setting value with the [Top 1] [Top 2] keys.
2. Press the [PTT] and the selected value is backed up and operation shifts to the next item for setting.
3. Press [Side 2] on the Group selection screen in order to return to Self programming mode.

- **Note**
1. Different sample displays are shown.
2. Setting item No.s are displayed with a 7-segment 2-digit figure on the LCD.
3. Self programming mode cannot be set when set to Disaable with the FPU.
4. A red LED lights up during TX frequency and TX signalling.
5. Press [Orange] on the TX, RX frequencies setting screen in order to clear in the channel frequencies data.
6. Press [Orange] on the signalling setting screen in order to change or off the signalling function.
7. Flipping [Toggle] to the right during setting of RX, TX frequencies and performing Up/Down operation allows frequencies to be changed in MHz steps.
8. The RX and TX frequencies can be entered with the number pad keys.

- **Flow Chart**
REALIGNMENT

3-3. Group Setting Mode

Set data for each Group while in this mode. After first entering Self programming mode, select the "GROUP" display with [Top 1] [Top 2] and press [PTT] to set Group Setting mode. Once in Group Setting mode, select the group that needs setting with the [Top 1] [Top 2] keys and press [PTT]. Next select the channel for setting with the [Top 1] [Top 2] keys and press [PTT]. The setting items and setting data will then appear so reset the data with the [Top 1] [Top 2] keys and press [PTT]. When finished, the display shifts to the next setting item. After finished setting all items press [PTT] to return to next Group selection.

No.	Function name	Display	Remarks
	Select Group	GRP 1	1~160
1	Battery save	BATT L	OFF, Short, Mid, Long
2	Time out timer	TOT 60	OFF, 30s~300s (30s step)
3	TOT pre alert	TOT.P 10	OFF, 1s~10s (1s step)
4	TOT rekey time	TOT.K 2	OFF, 1s~60s (1s setp)
5	TOT reset time	TOT.S 2	OFF, 1s~15s (1s step)
6	Group Delete/Add	D/A ADD	Delete, Add
7	Signalling	SIG AND	AND, OR

• **Operation**
1. Select the setting value with the [Top 1] [Top 2] keys.
2. Press the [PTT] and the selected value is backed up and operation shifts to the next item for setting.
3. Press [Side 2] on the Group selection screen in order to return to the Self programming mode initial display.

• **Note**
1. Different sample displays are shown.
2. Setting item No.s are displayed with a 7-segment 2-digit figure on the LCD.
3. Self programming mode cannot be set when set to Disable with the FPU.

REALIGNMENT

• **Group Clone**

1. To clone the transceiver group data and channel data within the group, as well as group alphanumeric data, use the [Top 1] key or [Top 2] key to switch the display on the master side transceiver from "A CLONE" to "G CLONE".
2. Press [PTT] to show the group cloning selection.
3. Select the group with the [Top 1] or [Top 2] keys.
4. Press [PTT] to show the slave side group cloning selection.
5. Select the group with the [Top 1] or [Top 2] keys.
6. Press the master side [PTT] to start cloning.

Red lamp flashes
• **Flow Chart**
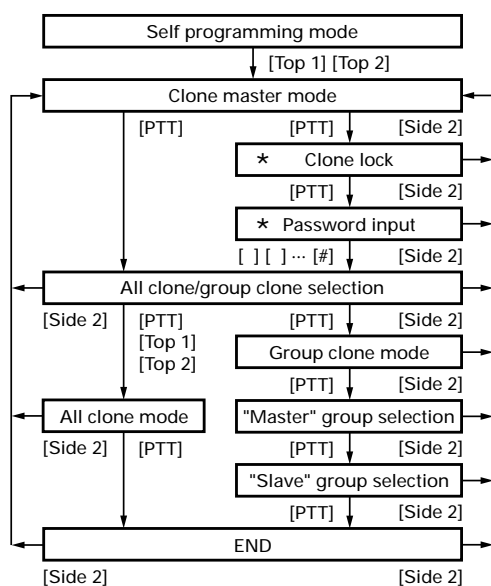

★ Only the keypad model and set to password with the FPU.

4. Firmware Programming Mode

4-1. Preface

Flash memory is mounted on the TK-390. This allows the TK-390 to be upgraded when new features are released in the future. (For details on how to obtain the firmware, contact Customer Service.)

4-2. Connection Procedure

Connect the TK-390 to the personal computer (IBM PC or compatible) with the interface cable (KPG-36). (Connection is the same as in the PC Mode.)

4-3. Programming

1. Start up the programming software (KPG-38D), select "firmware program" in the "Program" item, and press the Return key on the personal computer. This starts up the firmware programmer.
2. The top screen is displayed. Press any key to advance to the next screen.
3. Set the communications speed (normally, 38400 bps) and communications port in the Setup item.
4. Set the firmware to be updated by File select (=F1).
5. Held down the [Side 2] and [PTT]. Turn the TK-390 power on, and release [Side 2] first. Until the display change to "PROGRAM"
6. Check the connection between the TK-390 and the personal computer, and make sure that the TK-390 is in the Program mode.
7. Press F10 on the personal computer. A window opens on the display to indicate progress of writing. When the TK-390 starts to receive data, "PG" is appeared on 2 digit sub display.
8. If writing ends successfully, the red LED on the TK-390 lights and the checksum is displayed.
9. If you want to continue programming other TK-390s, repeat steps 5 to 8.

Notes :

• To start the Firmware Programmer from KPG-38D, the Fpro path must be set up by KPG-38D setup.
• This mode cannot be entered if the Main Program mode is set to Disable in the Programming software (KPG-38D).

4-4. Function

1. If you press the [Top 2] switch while "PROGRAM" is displayed, the checksum is displayed. If you press the [Top 1] switch while the checksum is displayed, "PROGRAM" is redisplayed.
2. If you press the [Top 1] switch while "PROGRAM" is displayed, 1 dot light ("M ") to indicate that the write speed is low-speed (19200 bps). If you press the [Top 1] switch again while low-speed (19200 bps), 2 dot lights (" M ") to indicate, and the write speed becomes the high-speed mode (38400 bps).

Note :

Normally, write in the high-speed mode.

5. Panel Test Mode

Setting method refer to ADJUSTMENT.

TK-390

<h1 style="text-align:center">CIRCUIT DESCRIPTION</h1>

1. Overview

The KENWOOD model TK-390 is a UHF/FM hand-held transceiver designed to operate in the frequency range of 450 to 490MHz, the unit consists of a receiver, a transmitter, a phase-locked loop (PLL) frequency synthesizer, power supply circuits, a control unit.

2. Circuit Configuration by Frequency

The receiver is a double-conversion superheterodyne with a first intermediate frequency (IF) of 44.85MHz and a second IF of 455kHz. Incoming a signals from the antenna are mixed with the local signal from the PLL to produce the first IF of 44.85MHz.

This is then mixed with the 44.395MHz second local oscillator output to produce the 455kHz second IF. This is detected to give the demodulated signal.

The transmit signal frequency is generated by the PLL VCO, and modulated by the signal from the microphone. It is then amplified and sent to the antenna.
Fig. 1   Frequency configuration

3. Receiver System

3-1. Front-end RF amplifier

The signal coming from the antenna passes through the transmit/receive switching diode circuit, is amplified by the RF amplifier (Q200), and passes through a BPF (L205). The resulting signal is further amplified by the RF amplifier (Q201), passes through a BPF (L210) and goes to the mixer. The band-pass filters (L205 and L210) are two-pole helical resonators that uses varactor diode tuning to reject unwanted signal components.

3-2. First mixer

The 1st mixer uses the GaAs IC (IC200). The 1st mixer mixes the signal with the 1st local oscillator frequency from the VCO, and converts it to the 1st IF (44.85MHz).

The signal then passes through monolithic crystal filter (XF300 ; Wide, XF301 ; Narrow) to remove unnecessary nearby frequency components. The signal from the MCF is used as the 1st IF signal.

3-3. IF amplifier

The 1st IF signal is amplified (Q302) and fed into IC300 in the FM IF IC. The IF signal is then mixed with the 2nd local oscillator frequency of 44.395MHz to generate the 2nd IF of 455kHz. The 455kHz signal is then passed through a ceramic filter (CF300, CF301 ; Wide, CF302, CF303 ; Narrow) and fed back into IC300 for additional amplification.

Fig. 2   Receiver section

Table 1   Crystal filter XF300 (L71-0523-05) : Wide
Item	Rating
Nominal center frequency	44.85MHz
Pass band width	±5~7kHz or more at 3dB
Attenuation band width	±25kHz or less at 3dB
Ripple	1.0dB or less
Insertion loss	4dB or less
Guaranteed attenuation	80dB or more at fo±910kHz
	40dB or more within fo±1MHz
Terminating impedance	350Ω / 4.5pF

Table 2   Crystal filter XF301 (L71-0502-05) : Narrow

Item	Rating
Nominal center frequency	44.85MHz
Pass band width	±3.75kHz or more at 3dB
Attenuation band width	±12.5kHz or less at 25dB
Ripple	1.0dB or less
Insertion loss	4dB or less
Guaranteed attenuation	80dB or more at fo±910kHz
	40dB or more within fo±1MHz
Terminating impedance	350Ω / 4.5pF

CIRCUIT DESCRIPTION

3-4. Wide/Narrow changeover circuit

Narrow and Wide settings can be made for each channel by switching the MCF; XF300 (Wide), XF301 (Narrow) with the ceramic filters CF300, CF301 (Wide), CF302, CF303 (Narrow).

The WIDE (high level) and NARROW (low level) data is output from IC400 (I/O port expansion) pin 4.

When a WIDE (high level) data is received, Q300, Q303 turn off and Q301, Q304 turn on. When a NARROW (low level) data is received, Q300, Q303 turn on and Q301, Q304 turn off. D300, D301 switch to MCF or D302, D303 are switched to ceramic filters when a high/low level data is received.

Q305 turns on/off with the Wide/Narrow data and the IC300 detector output level is changed to maintain a constant output level during wide or narrow signals.
Fig. 3   Wide/Narrow changeover circuit
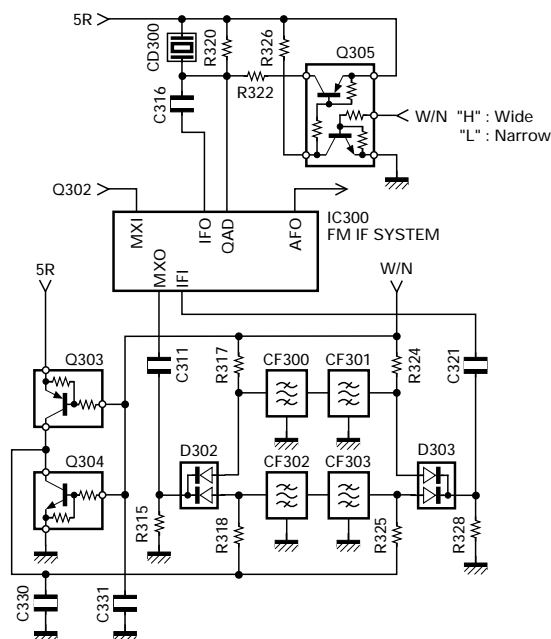

Fig. 4   Wide/Narrow changeover circuit

3-5. Audio amplifier circuit
• TX-RX unit

The demodulated signal from IC300 goes through IC301, and is amplified by IC601 (2/2), high-pass filtered, low-pass filtered, high-pass filtered, band-eliminate filtered, and de-emphasized by IC607.

The signal then goes through an electronic volume control (IC603), an AF amplifier IC604 (2/2), and an AF switch (Q8 is on and Q7 is on of the control unit), and is routed to audio power amplifier (IC1 of the control unit), where it is amplified and output to the internal speaker.

• Control unit

The audio mute signal (AMP SW) from the microprocessor becomes Low in the standby and Q5, Q6 which are power supply circuit for IC1 turn off. When the audio is output, AMP SW becomes High to turn Q5, Q6 on, and voltage is supplied to power terminal VP of IC1.

Speaker switching is done from IC403 (TX-RX unit) by INT AFC or EXT AFC. First, the logic level at the speakers switching terminal (SSW) on the universal connector is input to the microprocessor (IC406 TX-RX unit). The microprocessor then outputs data to IC403 based on this input.

When there is no SP-MIC installed, this logic level is high. When the INT AFC is high, the EXT AFC goes low, so the AF signal is only input to the amplifier for the internal speaker (INT SP) of IC1. However, when a SP-MIC has been installed, this logic level is low, so the INT AFC goes low and the EXT AFC goes high. So that the AF signal is input only to amplifier for the external speaker (EXT SP) of IC1.
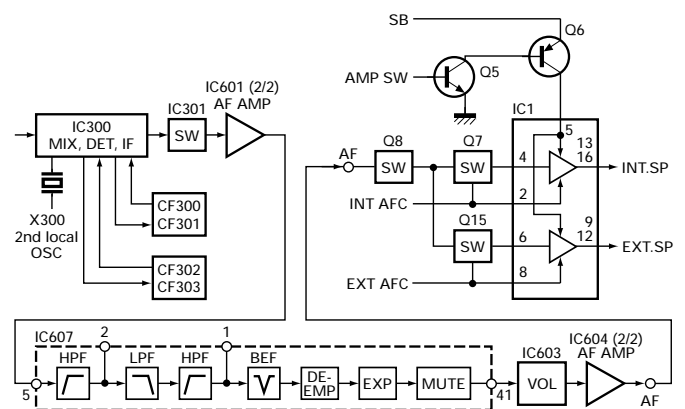

Fig. 5   Audio amplifier circuit

3-6. Squelch circuit

The output signal from the squelch circuit, which consists of IC605 (2/2) and Q600, is applied to the microprocessor. The microprocessor passes information to the shift register (IC403) and it controls the mute control lines (AMP SW, INT AFC, and EXT AFC) according to the input signal (noise pulse) and the microprocessor task condition.
Fig. 6   Squelch circuit

TK-390

CIRCUIT DESCRIPTION

4. Transmitter System

4-1. Microphone amplifier

The signal from IC3 (control unit) goes through the mute switch (Q403).

When the SP-MIC is not attached, the microphone switching terminal (MSW) on the universal connector becomes High, and mute switch (Q403) is turned on. When the SP-MIC is attached, MSW is connected to GND at inside of SP-MIC. For this reason, Q403 is turned off, the internal microphone is muted, and only the input of the external microphone is supplied to the microphone amplifier of the TX-RX unit.

The signal from microphone passes through the limiter circuit in D601, and through the high-pass filter, the ALC circuit, the low-pass filter, the high-pass filter, and pre-emphasis/IDC circuit in IC607. When encoding DTMF, mute switch (Q601) is turned off for muting the microphone input signal.

The signal passes through the D/A converter (IC603) for the maximum deviation adjustment, and enters the summing amplifier consisting of IC605 (1/2), and is mixed with the low speed data from the CPU (IC406).

The output signal from the summing amplifier goes to the VCO modulation input.

The other output signal from the summing amplifier passes through the D/A converter (IC603) again for the BAL adjustment, and the buffer amplifier (IC604 1/2), and goes to the VCXO modulation input.

4-2. Noise cancelling microphone circuit

The two signals from INT MIC (Main & Sub) are input to the positive (+) input (Sub) and to the negative (–) input (Main) of the IC3. If the same signal is input to both Main and Sub, the Main signal is canceled at the output of IC3 (pin 7). In other words, noise from nearby sources not directly connected to the transceiver enters the Main and Sub inputs at the same signal and is therefore canceled out.

When a signal is only input to Main and there is no signal at Sub, the Main signal is output as is, from IC3 (pin 7). In other words, only the voice audio of the operator in extermely close proximity to the Main MIC is input to Main so that the signal is output as is from IC3 (pin 7). Also, when the "N/C" switch is set to "L", transistor Q14 turns off so Sub microphone turns off and operation is the same as above.

4-3. Drive and Final amplifier

The signal from the T/R switch (D7 is on) is amplified by the pre-drive (Q6) and drive amplifier (Q8) to 20mW. The output of the drive amplifier is amplified by the RF power amplifier (IC501) to 4W (1W when the power is low).

The RF power amplifier consists of two stages MOS FET transistor. The output of the RF power amplifier is then passed through the Transmit-Receive (TX-RX) antenna switching (D10 is on) and the harmonic filter (LPF) and the Internal-External (INT-EXT) antennal switching (in the universal connector) and applied to the antenna terminal.
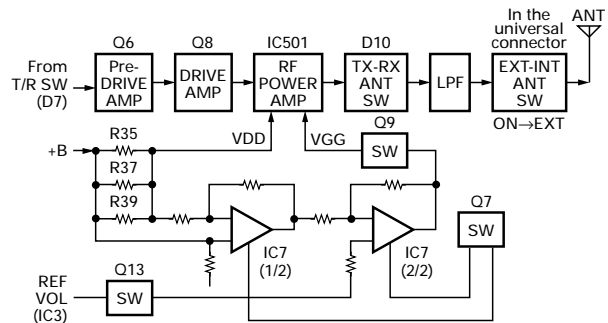

Fig. 8   Drive and final amplifier and APC circuits

4-4. Internal-External (INT-EXT) antenna switching

The INT-EXT antenna switch housed inside the universal connector only switches to the EXT ANT side when an antenna speaker-microphone has been installed.

This INT-EXT antenna switch works mechanically and switches based on the operation shown in Figure 9.
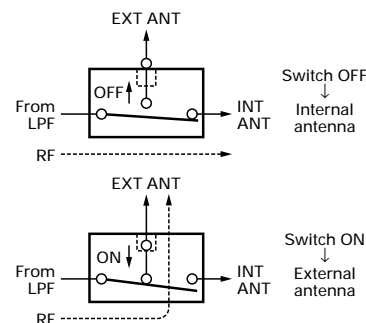

Fig. 9   Internal-External antenna switching

Fig. 7   Microphoen circuit

18

CIRCUIT DESCRIPTION

4-5. APC circuit

The APC circuit always monitors the current flowing through the RF power amplifier (IC501) and keeps a constant current. The voltage drop at R35, R37, and R39 is caused by the current flowing through the RF power amplifier and this voltage is applied to the differential amplifier (IC7 1/2).

IC7 (2/2) compares the output voltage of IC7 (1/2) with the reference voltage from IC3, and the output of IC7 (2/2) controls the VGG of the RF power amplifier to make the both voltages to same voltage.

The change of power high/low is carried out by the change of the reference voltage. Q7, Q9, and Q13 are turned on in transmit and the APC circuit is active. (See Figure 8)

5. PLL Frequency Synthesizer

The frequency synthesizer consists of the VCXO (X1), VCO (IC10), PLL IC (IC5) and buffer amplifiers.

The VCXO generates 16.8MHz. The frequency stability is within 2.0ppm (temperature range of –30 to +60°C). The frequency tuning and modulation of the VCXO are done to apply a voltage to pin 1 of the VCXO. The output of the VCXO is applied to pin 8 of the PLL IC.

The VCO of TK-390 covers the 40MHz spread, setting frequencies in r1, r2 (receive) and t1, t2 (transmit) with a bias voltage applied to the –V terminal of the VCO. A zero (0) volt bias is applied at frequencies lower than r1, t1. Frequencies r1, t1 through r2, t2 are biased with –3 volts. Frequencies higher than r2, t2 are biased with –6 volts.

The relation of VCO frequency versus PLL lock voltage is shown in Figure 11.

The output of the VCO is amplified by the buffer amplifier (Q3) and routed to the pin 5 of the PLL IC. Also the output of the VCO is amplified by the buffer amplifier (Q5) and routed to the next stage according to T/R switch (D7).

The PLL IC consists of a prescaler, fractional divider, reference divider, phase comparator, charge pump. This PLL IC is fractional-N type synthesizer and performs is the 40 or 50kHz reference signal which is eighth of the channel step (5 or 6.25kHz). The input signal from the pins 1 and 5 of the PLL IC is divided down to the 40 or 50kHz and compared at phase comparator. The pulsed output signal of the phase comparator is applied to the charge pump and transformed into DC signal in the loop filter (LPF). The DC signal is applied to the pin 4 of the VCO and locked to keep the VCO frequency constant.

PLL data is output from DT (pin21), CLK (pin 22) and LE (pin 20) of the microprocessor (IC406). The data are input to the PLL IC when the channel is changed or when transmission is changed to reception and vice versa. A PLL lock condition is always monitored by the pin 28 (UL) of the microprocessor. When the PLL is unlocked, the UL goes low.
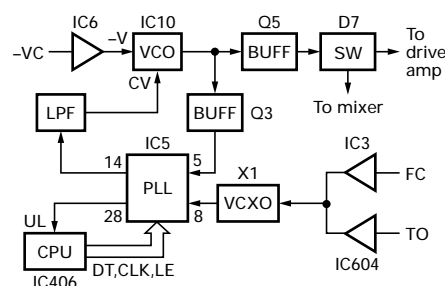

Fig. 10   PLL block diagram
Fig. 11   CV voltage vs frequency

6. Power Supply Circuit

Battery +B is supplied via a 3A fuse from the battery terminal connected to the TX-RX unit. After passing through the power switch power supply (SB) is applied to the two AVR ICs, and AVR circuit.

IC401 supplies 5V (5CM) to the control circuit. IC402 supplies 5V (5M) to the common circuit.

AVR circuit (Q400, Q402, Q405, Q406) supplies voltage to the TX circuit and the RX circuit. 5C is common 5V and output when SAVE is not set at off. 5R is 5V for reception and output during reception. 5T is 5V for transmission and output during transmission.
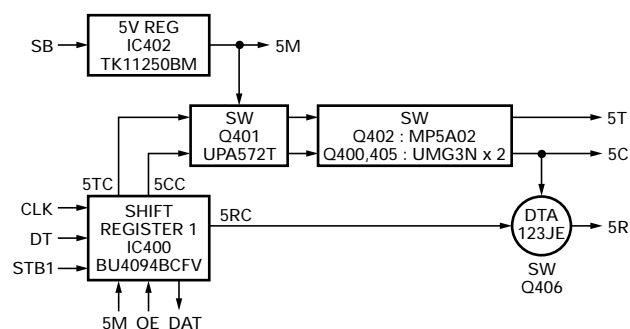

Fig. 12   Power supply circuit

TK-390

CIRCUIT DESCRIPTION

7. Control Circuit

The control unit consists of microprocessor IC406 and its peripheral circuits. It controls the TX-RX unit and transfers data to and from the control unit. The CPU (IC406) mainly performs the following :

1) Switching between transmission and reception by PTT signal input.
2) Reading channel, frequency, and program data from the memory circuit.
3) Sending frequency program data to the PLL.
4) Controlling squelch on/off by the pulse signal input from the squelch circuit.
5) Controlling the audio mute circuit by decode data input.
6) Transmitting encode data (QT, DTQ).
7) Sending serial data to output expander (IC400, IC403, IC404 and IC405) to control various function in the unit.

7-1. Memory circuit

IC406 has a flash memory with a capacity of 1M bits that contains the transceiver control program for the CPU and data such as transceiver channels and operating features.

This program can be easily written from an external devices. Data, such as DTMF memories and operating status, are programmed into the EEPROM (IC412).
Fig. 13   Memory circuit

7-2. CPU clock shift

When the CPU (IC406) 14MHz clock (X400) high frequency (actually the integral double high frequency of 7MHz because it is halved) is multiplexed with the reception frequency, it becomes an internal beat signal, suppressing the signal sensitivity. To prevent this, by turning Q407 on, the clock frequency is shifted (about 4kHz).

(Shift on/off can be set through programming.)
Fig. 14   CPU clock frequency shift

7-3. Shift register

IC400, 403, 404 and 405 is an interface IC for I/O port expansion. It is used to expand the CPU (IC406) output ports.

7-4. D/A converter

IC3 and IC603 is used as a conventional semi-fixed-resistor converter. It sets the following :
1) RX sensitivity
2) Transmission power
3) Modulation level
4) Audio power
5) Frequency

7-5. Key input

It the clock is supplied to CLK terminal when the RES terminal (CPU pin 70) of the decade counter (IC2) is set to Low, Q0 to Q7 become High sequentially. Normally, KI1 and KI2 are Low (pulled down). When any key is pressed, KI1 or KI2 become High. The CPU detects which key is pressed, according to the voltage of KI1 and KI2 and clock timing.
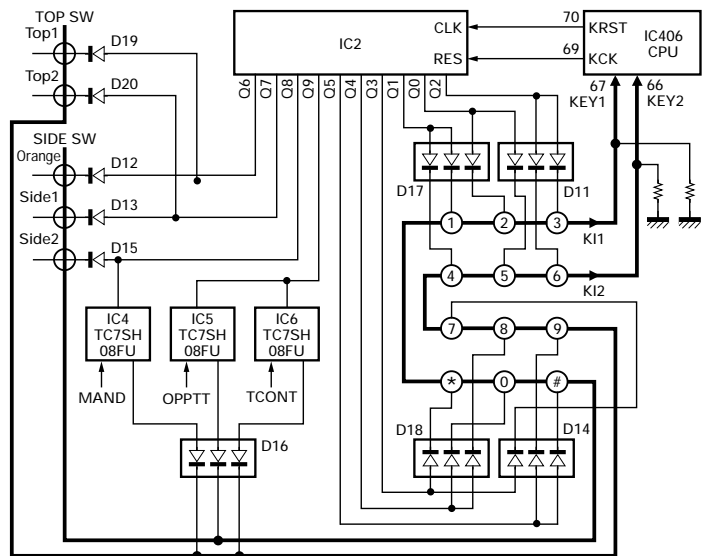

Fig. 15   Key input
Fig. 16   Decade counter timing chart

CIRCUIT DESCRIPTION

7-6. Low battery warning

The battery voltage is monitored by the microprocessor (IC406). When the battery voltage falls below the voltage set by the Low Battery Warning adjustment, the red LED flashes to notify the operator that it is time to replace the battery. If the battery voltage falls even more (approx. 5.8V), a beep sounds and transmission is stopped.

Low battery warning	Battery condition
The red LED flashes during transmission	The battery voltage is low but the transceiver is still usable
The red LED flashes and continuous beep sounds while PTT pressed.	The battery voltage is low and the transceiver is not usable to make calls.

8. Signalling Circuit

8-1. Encode

The CPU (IC406) transmits the encode data selected by the program.

• Low-speed data (QT, DQT)

Low-speed data is output from pin 35 of the CPU. The signal passes through a low-pass CR filter, and goes to the summing amplifier (IC605 1/2). The signal is mixed with the audio signal and goes to the VCO (IC10) and VCXO (X1) modulation input after passing through the D/A converter (IC603) for BAL adjustment.

• High-speed data (DTMF)

High-speed data is output from pin 36 of the CPU. The signal passes through a low-pass filter consisting of IC413, and provides a TX DTMF tone and a RX DTMF tone including a beep tone. The TX DTMF tone is passed to the D/A convertor (IC603) for DTMF deviation adjustment, and then applied to the audio processor (IC607).

The signal is mixed with the audio signal and goes to the VCO and VCXO. The RX DTMF tone is passed the D/A convertor (IC603) for audio control, summing amplifier (IC604 2/2), audio power amplifier and then to the speaker.
Fig. 17   Encode

8-2. Decode

• Low-speed data (QT, DQT)

The demodulated signal from the FM IF IC (IC300) is amplified by IC601 (2/2) and passes through a low-pass filter (IC602) to remove audio components. The signal is input to pin 26 of the CPU.

The CPU digitizes this signal, performs processing such as DC restoration, and decodes the signal.

• High-speed data (DTMF)

The DTMF input signal from the FM IF IC (IC300) is amplified by IC601 (2/2) and goes to IC600, the DTMF decoder. The decoded information is then processed by the CPU. During transmission and standby, the DTMF IC is set to the power down mode when the PD terminal is High. When the line is busy, the PD terminal becomes Low, the power down mode is canceled and decoding si carried out.

• High-speed data (2 tone)

The demodulated signal from the FM IF IC (IC300) is amplified by IC601 (2/2) and passes through an audio processor (IC607) and band-pass filter (IC606) to remove a low-speed data.

The CPU digitizes this signal, performs processing such as DC restoration, and decodes the signal.

Fig. 18   Decode

TK-390
CIRCUIT DESCRIPTION

9. Option Board Terminal

Terminals for mounting the option board are provided at the bottom of the TX-RX unit. The table below shows the correspondence between the board and terminals. Disconnect R414 and R665 in TX-RX unit when the option board is attached.
Fig. 19

9-1. Option port 1 (For ANI board etc.)

Name	Function	Note
DATI	Data input Received signal to board	Reference 1kHz STD Dev → 250~350mVrms
DATO	Data output Modulation (ANI) output from board	Reference 1kHz/150mVrms → 2.5~3.5kHz/wide 1.25~1.75kHz/narrow
TCONT	SP amp control from board	
STONE	Side tone from board	
AUDIH	MIC inhibit from board	
E	Ground	
MUTE	AF mute from board	
SCALL	Sel call LED port from board	No connection
AUX	EM CH request from board	EM : Emergency
PTT	PTT logic to baord	
MAND	Man down logic to board	
EMERG	EM CH logic to board	EM : Emergency
BUSY	Busy logic to baord	
KEY	TX request from board	TX : Transmission
A+	Power supply for board	Switched

9-2. Option port 2 (For voice scrambler etc.)

Name	Function	Note
CODE1	Scramble code select port 1	LSB
CODE2	Scramble code select port 2	
CODE3	Scramble code select port 3	
CODE4	Scramble code select port 4	MSB
TXOUT	Modulation output from board	Reference 1kHz/15mVrms → 2.5~3.5kHz/wide 1.25~1.75kHz/narrow
RXOUT	Received signal output from board	
NC	No Connection	
E	Ground	
PTTIO	TX (Low) / RX (High) to board	
CLR/C (AUX)	Clear (High) / Scramble (Low) to board (C : means Code)	
RXAEN	Power save request for board Save : Low	
RXIN	Received signal input to board	Reference 1kHz STD Dev → 250~350mVrms
TXIN	Modulation input to board	
+V	Power supply for board	Switched

4. DC-DC Converter : MAX865 (TX-RX Unit IC4)

4-1. Terminal connection
4-2. Terminal description

Pin No.	Name	Function
1	C1–	Negative terminal of the flying boost capacitor.
2	C2+	Positive terminal of the flying inverting capacitor.
3	C2–	Negative terminal of the flying inverting capacitor.
4	V–	Output of the inverting charge pump.
5	GND	Ground
6	IN	Positive power supply input
7	V+	Output of the boost charge pump.
8	C1+	Positive terminal of the flying boost capacitor.

4-3. Electrical characteristics

Parameter	Conditions	MIN	TYP	MAX	Units
Minimum supply voltage	$R_{LOAD}=10k\Omega$	2.0	1.5		V
Maximum supply voltage	$R_{LOAD}=10k\Omega$			6.0	V
Supply current	$T_A=+25°C$		0.6	1.05	mA
	$T_A=-40°C$ to $+85°C$ (Note 1)			1.15	
Oscillator frequency	$T_A=+25°C$	19.5	24	32.5	kHz
	$T_A=-40°C$ to $+85°C$ (Note 1)	18		34	

Note 1 : These specifications are guaranteed by design and are not production tested.

5. LCD Driver : LC75824W (Control unit IC101)

5-1. Block diagram
5-2. Terminal function

Pin No.	Name	I/O	Active	Function
1~12	S1/P1~S12/P12	O	–	Segment output for displaying
13~51	S13~S51			data transferred from serial data.
52~55	COM1~COM4	O	–	Common driver output. Frame frequency fo=(fosc/512)Hz
56	VDD	–	–	
57	VDD1	I	–	Apply 2/3 the LCD drive bias voltage from outside. If 1/2 the bias is applied, connect to VDD2.
58	VDD2	I	–	Apply 1/3 the LCD drive bias voltage from outside. If 1/2 the bias is applied, connect to VDD1.
59	VSS	–	–	
60	OSC	I/O	–	Oscillation terminal.
61	INH	I	L	Force the display to turn off regardless of internal data. Serial data can be input regardless of whether it is "H" or "L".
62	CE	I	H	Chip enable. Serial data transfer terminal. Connected to the microprocessor.
63	CL	I	_↑_	Synchronizing clock. Serial data transfer terminal. Connected to the microprocessor.
64	DI	I	–	Transfer data. Serial data transfer terminal. Connected to the microprocessor.

DISASSEMBLY FOR REPAIR

Disassembly of Front Case and Chassis

1. Remove the 2 screws (❶) and a cap fixed screw (❷).
2. Press the chassis bottom upwards and remove the clips (❸) at the top. The front case is still connected to the chassis by the FPC at this time so be gentle when lifting upwards, otherwise unwanted stress is applied on the FPC.
3. The front case and chassis can only be opened to the side when connected by the FPC (❹).

Front case

Chassis

Remove the TX-RX Unit from the Chassis

1. The TX-RX unit cannot be removed simply by removing the seven screws (❺).
2. A total of 9 solder connections, 6 on the RF power module (❻) and 3 on the antenna daughter board (❼) must be disconnected.

Remove the Universal Connector

1. The universal connector (❽) is fastened to the chassis with bouble-side tape.
2. First unsolder the connection on the antenna daughter board (❾).
3. Press firmly with a tool such as a screwdriver and so that it can peel (❿).
   Note : You must replace both parts together when replacing the universal connector or the FPC (⓫).

Remove the Side Key Assy

1. The side key assy is clips form a slide-hook structure. Lift up gently and take from the side (⓬).

Side key assy

The waterproof packing for the front case cannot be removed unless the control unit is detached.

Chassis
Disassembly of the Panel Assy

1. The LCD assy and toggle switch are joined by wire (⓭). Use caution not to break this wire during handling.

Toggle switch

LCD assy

Panel assy
ADJUSTMENT

Test Equipment Required for Alignment

No.	Test Equipment		Major Specifications
1	Standard Signal Generator (SSG)	Frequency Range Modulation Output	Maximum 600MHz or more. Frequency modulation and external modulation. –133dBm/0.05μV to 7dBm/501mV
2	Power Meter	Input Impedance Operation Frequency Measurement Range	50Ω. Up to 600MHz. Full scale of 10W or so.
3	Deviation Meter	Frequency Range	400 to 560MHz.
4	Digital Volt Meter (DVM)	Measuring Range Accuracy	FS=18V or so. High input impedance for minimum circuit loading.
5	Oscilloscope		DC through 30MHz.
6	High Sensitivity Frequency Counter	Frequency Range Frequency Stability	Up to 1GHz or so. 0.2ppm or less.
7	Ammeter		5A.
8	AF Volt Meter (AF VTVM)	Frequency Range Voltage Range	50Hz to 1MHz. 1mV to 10V.
9	Audio Generator (AG)	Frequency Range Output	100Hz to 100kHz or more. 0 to 1V.
10	Distortion Meter	Capability Input Level	3% or less at 1kHz. 50mV to 10Vrms.
11	16Ω Dummy Load		Approx. 16Ω, 5W.
12	Regulated Power Supply		5V to 10V, approx. 5A Useful if ammeter equipped.
13	Spectrum Analyzer	Measuring Range	DC to 1GHz or more.
14	Tracking Generator	Center Frequency Frequency Deviation Output Voltage	50kHz to 600MHz. ±35MHz. 100mV or more.

■ **The following parts are required for adjustment**

1. Antenna connector adapter

The antenna connector of this radio uses an SMA terminal.

Use an antenna connector adapter [SMA(f) – BNC(f) or SMA(f) – N(f)] for adjustment. (The adapter is not provided as an option, so buy a commercially-available one.)

Note

When the antenna connector adapter touches the knob, draw out the knob to mount the connector.

2. Universal connector

Use the interface cable (KPG-36) for PC tuning or the lead wire with plug (E30-3287-08) and screw (N08-0535-08) for panel tuning. Connct the plug to the universal connector of the radio and tighten the screw.

The lead wire with plug (E30-3287-08) and screw (N08-0535-08) terminals are as follows. Numbers are universal connector terminal numbers.

Caution

1. When connecting the plug to the universal connector of the radio, a short circuit may occur. To provent this, be sure to turn the radio POWER switch off.
2. Since the RX AF output is a BTL output, there is a DC component. Isolate this with a capacitor or transformer as shown in the figure.
3. Do not connct an instrument between red or black and GND.

• **Universal connector**

Repair Jig (Chassis)

Use jig (part No.: A10-1399-03) for repairing the TK-390 Place the TX-RX unit on the jig and fit it with 7 screws.

Note : Supply power from an external power supply (Battery terminal : +, jig (chassis) : –)

Battery terminal (+)

TX-RX unit

Jig
How to Remove the Flat Cable

1. Gently draw out both sides of the connector lever uniformly in the direction of the arrow with tweezers. (CN101, CN400)

Flat cable
Tweezers

Lever

2. Gently rise up the connector lever in the direction of the arrow with a fine regular screwdriver or tweezers. (CN1, CN3, CN401, CN403)

Note : Gently push both sides of the connector lever, when put in the flat cable.

ADJUSTMENT

Panel Test Mode

This mode is used for making transceiver connection tests and clearing the memory.

To set Panel test mode, turn on the power with [Side 2] and [PTT] are still held down and then first release [PTT]. This mode cannot be set when disabled with the FPU.

In Panel test mode, when channel or signalling is selected, the signalling that was most recently used is displayed.

Channel   Signalling

```
 CH  1- 2
```
Key operations in Panel test mode are as follows.

[Selector switch] : Use to select the test channel.
[PTT]   : For transmit.
[Top 1]   : For down signalling.
[Top 2]   : For up signalling.
[Side 1]   : For setting Panel tuning mode.
[Side 2]   : For switching power between Hi/Low. Enter the LCD all lamp mode if held down for 2 seconds.
[Orange]   : For monitoring.
[Toggle]   : For switching between Wide/Narrow.

Frequency (MHz)

CH	RX	TX
1	470.1000 (Center)	470.0000 (Center)
2	450.1000 (Low)	450.0000 (Low)
2	489.9000 (Hi)	489.9750 (Hi)
4	470.0000	470.0000
5	470.2000	470.2000
6	470.4000	470.4000

Signalling

| No.	Encode tone	Decode tone
1	None	None

LEVEL DIAGRAM
To make measurements in the AF section, connect the AC level meter. (ANT input : –47dBm, 1kHz FM, 3kHz DEV.)
In the RF section, use a 1000pF coupling capacitor. (The display shows the SSG input value required to obtain 12dB SINAD.)

AG is set to the MIC input becomes 3kHz DEV. at 1kHz MOD.
To make measurements in the AF section, connect the AC level meter.
In the RF section, use a 1000pF coupling capacitor.

TERMINAL FUNCTION

| CN No.	Pin No.	Name	I/O	Function
				TX-RX UNIT (X57-5400-10)
CN400	1	CH D	I	CH switch data.
	2	CH A	I	CH switch data.
for	3	CH C	I	CH switch data.
X53	4	CH B	I	CH switch data.
(B/6)	5	E	–	GND.
	6	VOL	I	Voltage level input for audio control.
	7	5CM	–	5V.
	8	B+	–	Power input after passing through the fuse.
	9	B+	–	Power input after passing through the fuse.
	10	SB	–	Power output after power switch.
	11	SB	–	Power output after power switch.
	12	TOGGLE	I	Normally : 5V, switched toggle when connected GND.
	13	KEY2	I	Key input.
	14	Q6	O	Key scan IC Q6 signal output.
	15	Q7	O	Key scan IC Q7 signal output.
	16	LCDCS	O	Chip select output for LCD driver.
	17	CLK	O	Clock data output for LCD driver.
	18	DAT	O	Data output for LCD driver.
	19	LAMP	–	Backlight LED control. Normally : 0V, Lighting : 7.5V
	20	TXLED	–	TX LED control. Normally : 0V, Lighting : 7.5V
	21	BLED	–	Busy LED control. Normally : 0V, Lighting : 7.5V
	22	5M	–	5V.

    Input 0.5W
    Maximum input 1.5W
Dimensions .... 62 W x 81 H x 29 D (mm)
Weight (With plug cord) .... Approx. 0.17kg

KMC-25/26   Parts List

* : New parts

Ref. No.	New parts	Parts No.	Description	Model
		A02-2092-08	Case (Front)	25
	∗	A02-2253-08	Case (Front)	26
		A02-2093-08	Case (Rear)	25
	∗	A02-2254-08	Case (Rear)	26
		B09-0382-08	Cap (Phone)	
		D10-0629-08	Lever (PTT)	
		E30-3287-08	Lead wire with plug assy	25
	∗	E30-3322-08	Lead wire with plug assy	26
		J29-0644-08	Clip assy	
		J42-0495-08	Bushing	
		S70-0459-08	Tact switch	
		T07-0359-08	Speaker	
		T91-0584-08	MIC element	
		N08-0535-08	Dressed screw	

KSC-19 (CHARGER) / KSC-20 (RAPID CHARGER) / KPG-36 (PROGRAMMING INTERFACE CABLE) / KRA-15 (WHIP ANTENNA)

KSC-19   External View

KPG-36   External View

KSC-19   Charging

KNB-17A
Voltage	7.2V
Battery capacity	1500mAh
Charging time	Approx. 8 hours

KSC-20   External View

KRA-15   External View

M   : 450~490MHz
M2 : 470~512MHz
M3 : 403~430MHz

KSC-20   Specifications

Charging current	1100mA±150mA
Charging time	KNB-17A : 80 min.±24%
Source voltage	Approx 15V
Ambient temperature	0°C~40°C
Dimensions	105 W x 135 D x 52 H (mm)
Weight	0.18kg

TK-390

SPECIFICATIONS

GENERAL

Frequency Range	450 to 490MHz
Number of Channels	160 channels
Channel Spacing	Wide : 25kHz, Narrow : 12.5kHz
	(PLL channel step 5kHz, 25kHz)
Battery Voltage	7.5V DC ± 20%
Battery Life	10 hours at 4W (5-5-90 duty cycle)
Temperature Range	–30°C to +60°C (–22°F to +140°F)
Dimensions and Weight	6-3/32" (155mm) H x 2-5/16" (58mm) W x 1-1/2" (38mm) D, 1.25 lbs (565g)
With Keypad Model	6-3/32" (155mm) H x 2-5/16" (58mm) W x 1-9/16" (39.5mm) D

RECEIVER (Measurements made per EIA standard EIA-316-B)

Sensitivity

EIA 12dB SINAD	0.25µV
20dB Quieting	0.35µV
Selectivity	Wide : –73dB, Narrow : –68dB
Intermodulation...	Wide : –73dB, Narrow : –65dB
Spurious and Image Rejection............................	–73dB
Audio Power Output	500mW at less than 3% distortion
Frequency Stability	±0.0002% from –30°C to +60°C
Channel Frequency Spread	40MHz

TRANSMITTER (Measurements made per EIA standard EIA-316-B)

RF Power Output	Hi : 4W, Low : 1W
Spurious and Harmonics.....................................	–70dB
Type of Emission	Wide : 16K0F3E, Narrow : 11K0F3E
FM Noise	Wide : –45dB, Narrow : –40dB
Audio Distortion	Less than 3.0% at 1000Hz
Frequency Stability	±0.0002% from –30°C to +60°C
Channel Frequency Spread	40MHz
