# SPECIFICATIONS

## MODEL 101T AC POWER SOURCE

All specifications are tested in accordance with standard California Instruments test procedures and apply with a stable, low distortion input signal such as supplied from a T series plug-in oscillator.

POWER OUTPUT:	100 VA at 105 to 135 volts rms output from unity to $\pm 0.7$ power factor. See derating chart for operation at other output voltages and/or power factor.
*OUTPUT VOLTAGE RANGE:	0 to 135 volts rms.
TOTAL HARMONIC DISTORTION:	Less than 0.30% distortion from 200 Hz to 1 KHz; less than 0.5% distortion from 45 Hz to 10 KHz.
AMPLITUDE STABILITY: (after one hour warm-up)	$\pm 0.25\%$ for 24 hours at constant line, load and ambient temperature conditions.
LOAD REGULATION:	$\pm 1\%$ over the range from 45 Hz to 5 KHz and $\pm 2\%$ over the range from 45 Hz to 10 KHz when tested at unity power factor. In addition, a load regulation adjustment permits the regulation to be adjusted to zero at any given line voltage, signal frequency and load conditions. Control resolution is 0.1%.
LINE REGULATION:	$\pm 0.25\%$ of full output for a $\pm 10\%$ line change.
**FULL POWER FREQUENCY RANGE:	45 Hz to 10 KHz.
FREQUENCY RESPONSE:	$\pm 0.5$ dB from 45 Hz to 10 KHz.
AC NOISE LEVEL:	80 dB below full output when tested with a shorted input; 70 dB below full output when tested at full rated power output.
OVERLOAD AND SHORT CIRCUIT PROTECTION:	Complete protection from overloads and short circuits is provided. Automatic reset occurs when overload is removed.

\*Other output voltage ranges available on special order, consult factory.

\*\*This power source may be used over the 20Hz to 20KHz frequency range provided the output voltage and the output VA are derated according to Table 2-2 in this instruction manual; otherwise permanent damage to the unit may occur.

**AMPLIFIER DRIVE  
REQUIREMENTS:**  
(Normally obtained  
from plug-in)

**AC INPUT LINE:** 5 volts rms (maximum) produces 135 volts rms.

**AC INPUT FREQUENCY:** 105 to 125 volts rms. Unit may be wired for the following single phase voltages on special order: 208 VAC, 220 VAC, 230 VAC and 240 VAC.

**AC INPUT POWER:** 48 to 65 Hz. (400 Hz available on special order.)

**OPERATING TEMPERA-TURE RANGE:** 400 watts maximum under worst case line and full rated load conditions.

**FRONT PANEL METER:** 0 to 55 °C.

**DIMENSIONS:** 0 to 160 volt AC voltmeter provides ±1% of full scale accuracy at 400Hz and ±3% of full scale accuracy over the range from 45Hz to 10KHz.

**NET WEIGHT:** 3 1/2" high x 19" wide x 17.5" deep.

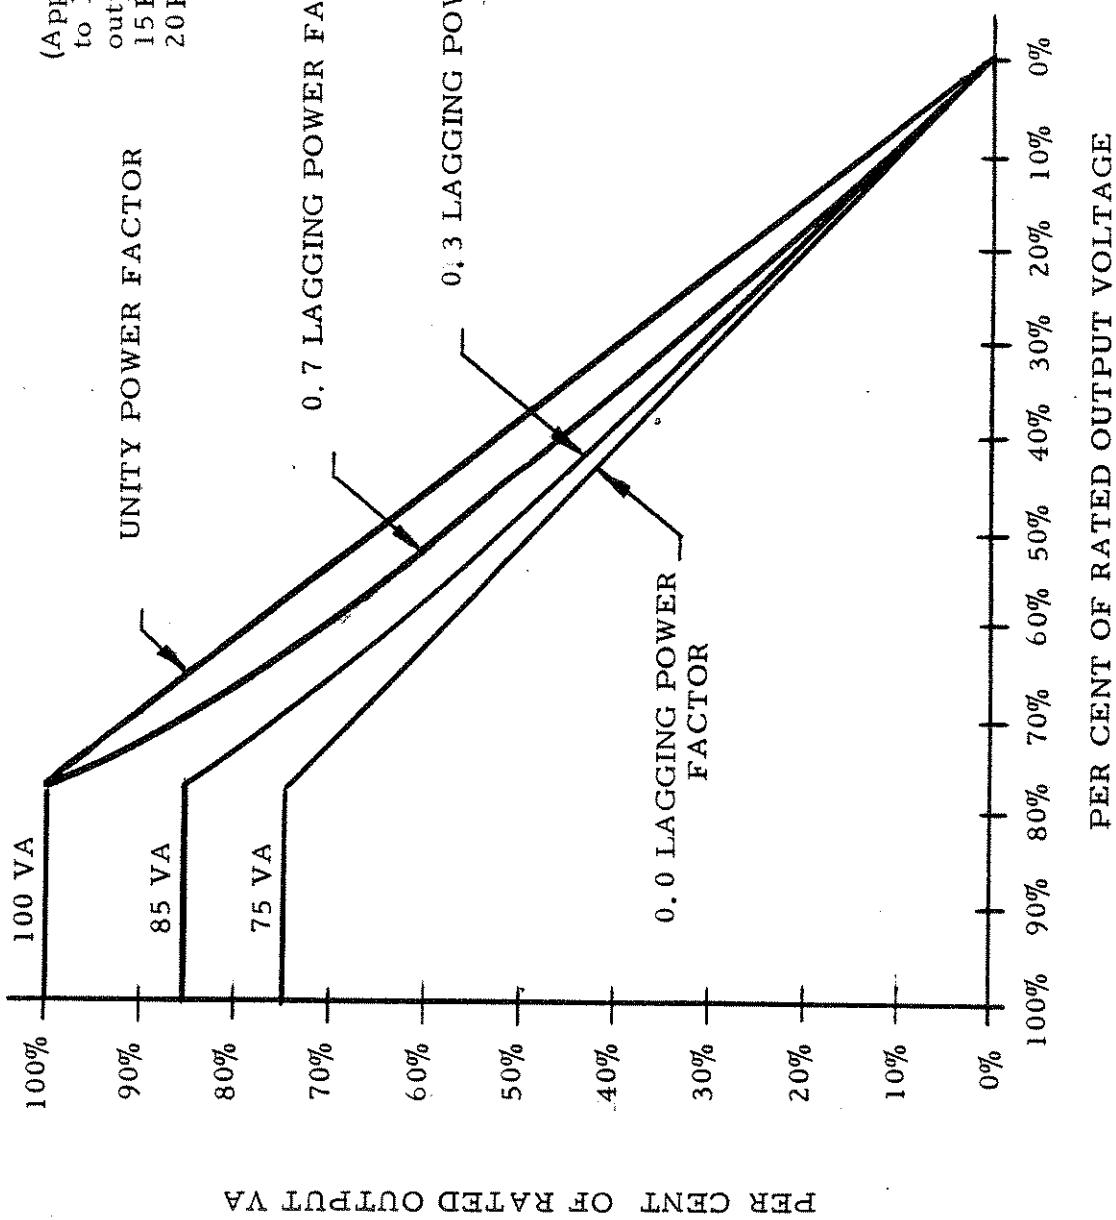

**SHIPPING WEIGHT:** 40 lbs.

**FRONT PANEL FINISH:** 45 lbs.

Grey, 26440 per Federal Standard 595 with black silk-screened lettering.

**DERATING CHART  
FOR 101T  
POWER AMPLIFIER**

(Applies over the range from 45 Hz to 10 KHz. Derate the curve for output VA by 1.5 to 1.0 factor at 15 KHz and 2.0 to 1.0 factor at 20 KHz.)

## **GENERAL DESCRIPTION**

### **1.1 INTRODUCTION**

This instruction manual contains information on the installation, operation, calibration and maintenance of the California Instruments Model 101T Power Source. Detailed schematics, parts location drawings, calibration procedures and theory of operation are also contained for the aid of maintenance personnel.

### **1.2 GENERAL DESCRIPTION**

The California Instruments Model 101T Power Amplifier is a solid state, high performance, low distortion power source that provides up to 100 VA output when used with the proper California Instruments Oscillator. The Model 101T Power Source is illustrated in Figure 1-1. Full power output is available from 105 volts to 135 volts rms and from 45 Hz to 10 KHz.

For two phase and three phase operation, at least two power amplifiers must be combined together with the applicable multi-phase oscillator. Two power amplifiers will provide a total of 200 VA two-phase power, or 200 VA of three-phase power in the open delta configuration. Three power amplifiers will provide 300 VA of three-phase power in the wye configuration.

### **1.3 ACCESSORY EQUIPMENT**

The following accessories are available for use with the California Instruments Model 101T Power Source.

- 1.3.1** Zero Manufacturing Company Model C300S-18 rack slides. These rack slides may be bolted directly to the sides of the unit, if required.
- 1.3.2** Series 800T Variable Frequency Oscillators. These general purpose Wien bridge oscillators provide one-phase, two-phase or three-phase outputs over the range from 20 Hz to 20 KHz in three bands. Units with single-phase output are designated as 800T-20/20K-1-1 $\phi$ , two-phase oscillators are designated as 800T-20/20K-1-2 $\phi$  and three-phase oscillators are designated as 800-20/20K-3 $\phi$ .
- 1.3.3** Series 815T Fixed Frequency Oscillators. These low-cost fixed frequency oscillators provide one-phase, two-phase, or three-phase outputs over the range from 45 Hz to 10 KHz. Units with single-phase output are designated as 815T-Freq.-.1-1 $\phi$ , two-phase oscillators are designated as 815T-Freq.-.1.2 $\phi$  and three-phase oscillators are designated as 815T-Freq.-.1-3 $\phi$ . Frequency accuracy is  $\pm 0.1$  percent at 25°C. Amplitude stability is 1.25 percent per 24 hours at 25°C and varies less than 0.02 percent per degrees centigrade. Harmonic distortion is less than 0.2 percent from 45 Hz to 10 KHz.

- 1.3.4 Series 835T Programmable Oscillators. These oscillators provide control of voltage amplitude, frequency, and phase angle in multiphase applications. Programming by either parallel BCD or IEEE-488 (1978) is available. These units are packaged in a separate 3.5 inch rack mountable chassis.
- 1.3.5 The Model 847T Programmable Oscillator is a digitally synthesized, crystal controlled oscillator featuring programmable amplitude and frequency via IEEE-488 BUS or BCD parallel. The 847T Oscillators are available in single-phase, two-phase 90°, three-phase 120° WYE, and three-phase 60° DELTA configurations.
- 1.3.6 Series 850T Oscillators. These oscillators are decade dialing, digitally synthesized, and crystal controlled. Basic accuracy is  $\pm 0.005\%$  of set frequency. Amplitude stability is 0.02% per 24 hours 23°C,  $\pm 0.01\%$  per C maximum average temperature coefficient from 0 to 55°C. The total harmonic distortion is less than 0.15 percent from 45 Hz to 999.9 Hz, less than 0.3 percent 45 Hz to 9999 Hz.

## **WARNING**

### **HIGH VOLTAGE (250 VAC)**

Voltages up to 250 VAC are available in certain sections of this power source. This equipment generates potentially lethal voltages.

## **DEATH**

on contact may result if personnel fail to observe safety precautions. Do not touch electronic circuits when power is applied. Avoid contact with pin C and pin D of the plug in oscillator, the primary power circuits, and the output circuits of the power source

## INSTALLATION AND OPERATION

### 2.1 UNPACKING

The California Instruments Model 101T Power Source is shipped in a cardboard container with protective inner packing. Do not destroy the packing container until the unit has been inspected for possible damage in shipment.

### 2.2 POWER REQUIREMENTS

- 2.2.1 The Model 101T Power Source has been designated to operate from any one of the following AC line voltages, 115 volts, 208 volts, 220 volts, 230 volts or 240 volts rms. The power transformer is normally wired at the factory for operation from the 115 volt line. Table 2-1 below indicates how the primary connections to the power transformer are made for various AC input line voltages.

TABLE 2-1

NOTE			
Prior to reconnection power transformer T1, remove all existing jumpers from the primary winding.			
Nominal Input Voltage	Operating Line Voltage Range	Power Transformer Connections	Front Panel Circuit Breaker Value
115 volts rms	105-125 volts rms	jumper pins 1 and 3; jumper pins 2 and 6; connect load side of circuit breaker to pin 6.	5 ampere
208 volts rms	190-226 volts rms	jumper pins 2 and 3; connect load side of circuit breaker to pin 4.	3 ampere
220 volts rms	201-239 volts rms	jumper pins 2 and 3; connect load side of circuit breaker to pin 5.	3 ampere
230 volts rms	210-250 volts rms	jumper pins 2 and 3; connect load side of circuit breaker to pin 6.	3 ampere
240 volts rms	219-261 volts rms	jumper pins 2 and 3; connect load side of circuit breaker to pin 7.	3 ampere

- 2.2.2 The Model 101T has been designated to operate over the line frequency range from 48 to 65 Hz. On special order, units will be supplied to operate from the 400 Hz line.
- 2.2.3 The normal input power, at 100 VA output, is between 250 and 400 watts depending on line and load conditions. During "turn-on" the peak transient will generally exceed 1000 watts.

### 2.3 CIRCUIT BREAKER REQUIREMENTS

The Model 101T Power Source uses a 5 ampere Heinemann AM12-5A curve 5 circuit breaker for operation from the 115 volt AC line. A Heinemann AM12-3A curve 5 circuit breaker is used for operation from the 208 volt through 240 volt AC lines. Substitution of circuit breaker type or current rating may cause permanent damage to the unit.

### 2.4 OUTPUT VOLTAGE AND METER RANGE

The Model 101T Power Source has a single output voltage range from 0 to 135 volts rms. The full scale front panel voltmeter range is 160 volts rms. The Model 101T is available with other output voltage ranges on special order.

### 2.5 ACCEPTANCE TEST PROCEDURE

Inspect the unit for any possible shipping damage immediately upon receipt. If damage is evident, notify the carrier. DO NOT return an instrument to the factory without prior approval. If the unit appears in good condition, perform the following:

- 2.5.1 Connect the AC line cord to an AC power line of the proper voltage and frequency as determined by either the serial number tag on the unit or by inspection of the wiring to the primary of the power transformer (see Section 2.2.1 of this instruction manual). Connect a 1 KW Variac and a 1.0 KW watt-meter in series with the AC line. The Model 101T Power Source should draw less than 60 watts under no load conditions at mid-line voltage.
- 2.5.2 Using either a California Instruments 800T Series Oscillator or a suitable external low distortion sine wave oscillator, set the oscillator to the desired frequency (between 45 Hz and 10 KHz) and adjust the output of the oscillator to 5 volts rms. The amplifier input is available at pin 2 (tie oscillator ground to pin 1) of the 12 pin terminal strip TB1 located on the rear of the unit, if the external oscillator is employed. Tie a jumper strap from pin 2 to pin 3 of TB1 if an 800T Series Plug-in Oscillator is being used as the signal source.

- 2.5.3 The output voltage range is given in Section 2.4 of this instruction manual. The following table lists the proper external load for full power output.

Output Voltage Range	Output Voltage	Full Power Load Resistance	50 Per Cent Power Load Resistance
0-135 volts rms	135 volts rms	182 ohms	364 ohms

- 2.5.4 Connect 182 ohm, 100 watt load resistor to the red and white binding posts on the rear of the power source. Connect a Tektronix Model 533A Oscilloscope or equivalent across this load resistor.
- 2.5.5 Using the GAIN control and the front panel METER, set the output voltage of the power source to 135 volts rms. The power line wattmeter should read between 200 and 300 watts at mid-line voltage. Check on the oscilloscope for peak clipping or excessive distortion of the sine wave output.
- 2.5.6 With the output still adjusted as determined in 2.5.5, place the 364 ohm resistor in parallel with the external load resistor to provide a 50 per cent overload on the output of the power source. The signal on the oscilloscope should exhibit significant clipping on both the positive and negative peaks.
- 2.5.7 Remove the 50 per cent overload resistor and the output should automatically return to normal.
- 2.5.8 Place a short circuit in parallel with the external load resistor and then remove the short circuit after a few seconds. The signal on the oscilloscope should go to zero and then return to normal when the short circuit is removed. The front panel circuit breaker may be activated if the short circuit remains across the output for a long period of time.
- 2.5.9 The CALIBRATION PROCEDURE given in Section 4.0 of this manual should be followed if a more detailed evaluation of the unit is required at this time.

## 2.6 MECHANICAL INSTALLATION

The Model 101T Power Source has been designed for rack mounting in a standard 19 inch rack. The unit should be supported from the bottom with a shelf-track or supported from the sides with a pair of rack slides (Zero Manufacturing type C300S-18 or equivalent).

The cooling fan on the rear of the unit must be free of any obstructions which would interfere with the flow of air. A 1.5 inch clearance should be maintained between the rear of the fans and the rear door of the mounting cabinet. Also, the air intake holes on the sides of the power source must not be obstructed.

## 2.7 INPUT POWER WIRING

The Model 101T Power Source will operate from single phase input voltages from 105 volts to 260 volts rms in five ranges as described in Section 2.2 of this manual. The power source should be used with 115 volt power lines with a capacity of 10 amperes or greater. If 200 to 260 volt AC lines are used, their capacity should be 5 amperes or greater.

## 2.8 OUTPUT POWER WIRING

The power output wires should be large enough to avoid excessive line voltage drops. The internal regulation control is capable of providing greater than 2 per cent over-regulation for all normal load conditions. If it is desired to provide a zero output impedance at the load side of the power wiring, it is necessary that these line drops be limited to approximately 1 to 2 per cent of the required output voltage. The following table lists the minimum acceptable wire size for a 1.0 per cent line drop assuming a 100 VA output at a distance of 20 feet from the power source to the load.

<u>Output Voltage</u>	<u>Maximum Line Drop</u>	<u>Load Current</u>	<u>Loop Length</u>	<u>Minimum Required Wire Size</u>
115 volts	1.15 volts	0.87 amperes	40 ft.	#25

The wire size should be reduced 3 sizes every time that the distance between the power source and load is doubled.

## 2.9 FRONT PANEL CONTROLS

- 2.9.1 The circuit breaker, located on the front panel of the Model 101T Power Source, is used to switch the POWER to the unit "on." At this time the amber indicator lamp located above this circuit breaker should glow.
- 2.9.2 The GAIN control is used to adjust the output voltage level of the power source. In the case of a multi-phase power source, the gain control is turned nearly fully clockwise and then used as a fine gain trim control. The amplitude of the output of the multi-phase system is controlled by the amplitude control located on the multi-phase oscillator.

- 2.9.3 The METER has a range of 0 to 160 volts AC and is used to read the value of the AC output voltage for normal applications of the power source.

CAUTION

This power source must not be driven at signal frequencies below 20 Hz or above 20 KHz, otherwise permanent damage to the unit may occur. For operation in the region between 20 Hz and 45 Hz and for operation in the region between 10 KHz and 20 KHz, derate the output voltage and output power according to Table 2-2 in order to provide reliable operation of the power source.

TABLE 2-2

Output Frequency	Maximum Safe Output Voltage on 0 to 135 Volt Range.	Maximum VA Output at Maximum Safe Output Voltage with $\pm 0.7$ Power Factor Load.
20 Hz	60 volts rms	52 VA
30 Hz	90 volts rms	85 VA
40 Hz	120 volts rms	100 VA
45 Hz to 10 KHz	135 volts rms	100 VA
15 KHz	90 volts rms	57 VA
20 KHz	67.5 volts rms	30 VA

## THEORY OF OPERATION

### 3.1 GENERAL

The California Instruments Model 101T Power Source is an all silicon solid state 100 VA amplifier and, with companion oscillator, is designed to provide reliable sine wave AC power over the frequency range from 45 Hz to 10 KHz.

A block diagram for the amplifier is shown in Figure 3-1. The pre-amplifier G1 is used to amplify the input signal to such a level so as to supply adequate drive to the power amplifier G2.

The power amplifier G2 provides the necessary sine wave signal to drive the output transformer T2. The output transformer has a floating secondary winding which allows the load to float from the amplifier and oscillator circuitry.

The power amplifier G2 contains the overload and short circuit protection circuitry. A local negative feedback loop is taken from the output of the power amplifier back to the pre-amplifier, G1.

The overall negative feedback is taken from the negative feedback winding on the output transformer back to one input of the pre-amplifier and provides a closed loop gain of 20 from the high side of A1R7 to the primary of T2.

The positive feedback signal is generated by sensing the IR drop across the primary of T2 and applying this signal to transformer A1T1. Transformer A1T1 converts this differential signal into a single-ended signal and applies it to the input of the pre-amplifier through a divider network containing the regulation control A1R3. As this positive feedback is increased from zero with potentiometer A1R3, the output impedance of the power source is reduced toward zero.

Power transformer T1, along with the associated rectifiers and filters, supply the operating voltages for the plug-in oscillator, the pre-amplifier G1 and the output amplifier G2.

### 3.2 DETAILED CIRCUIT DESCRIPTION

A schematic diagram for the Model 101T Power Source is shown in drawing E4010-070. The large printed circuit board is designated as the A1 assembly and contains the circuitry for the preamplifier and power amplifier section of the power source. For information on the plug-in oscillator, consult the applicable oscillator manual. These drawings give typical voltage levels and waveforms for the various sections of the power source.

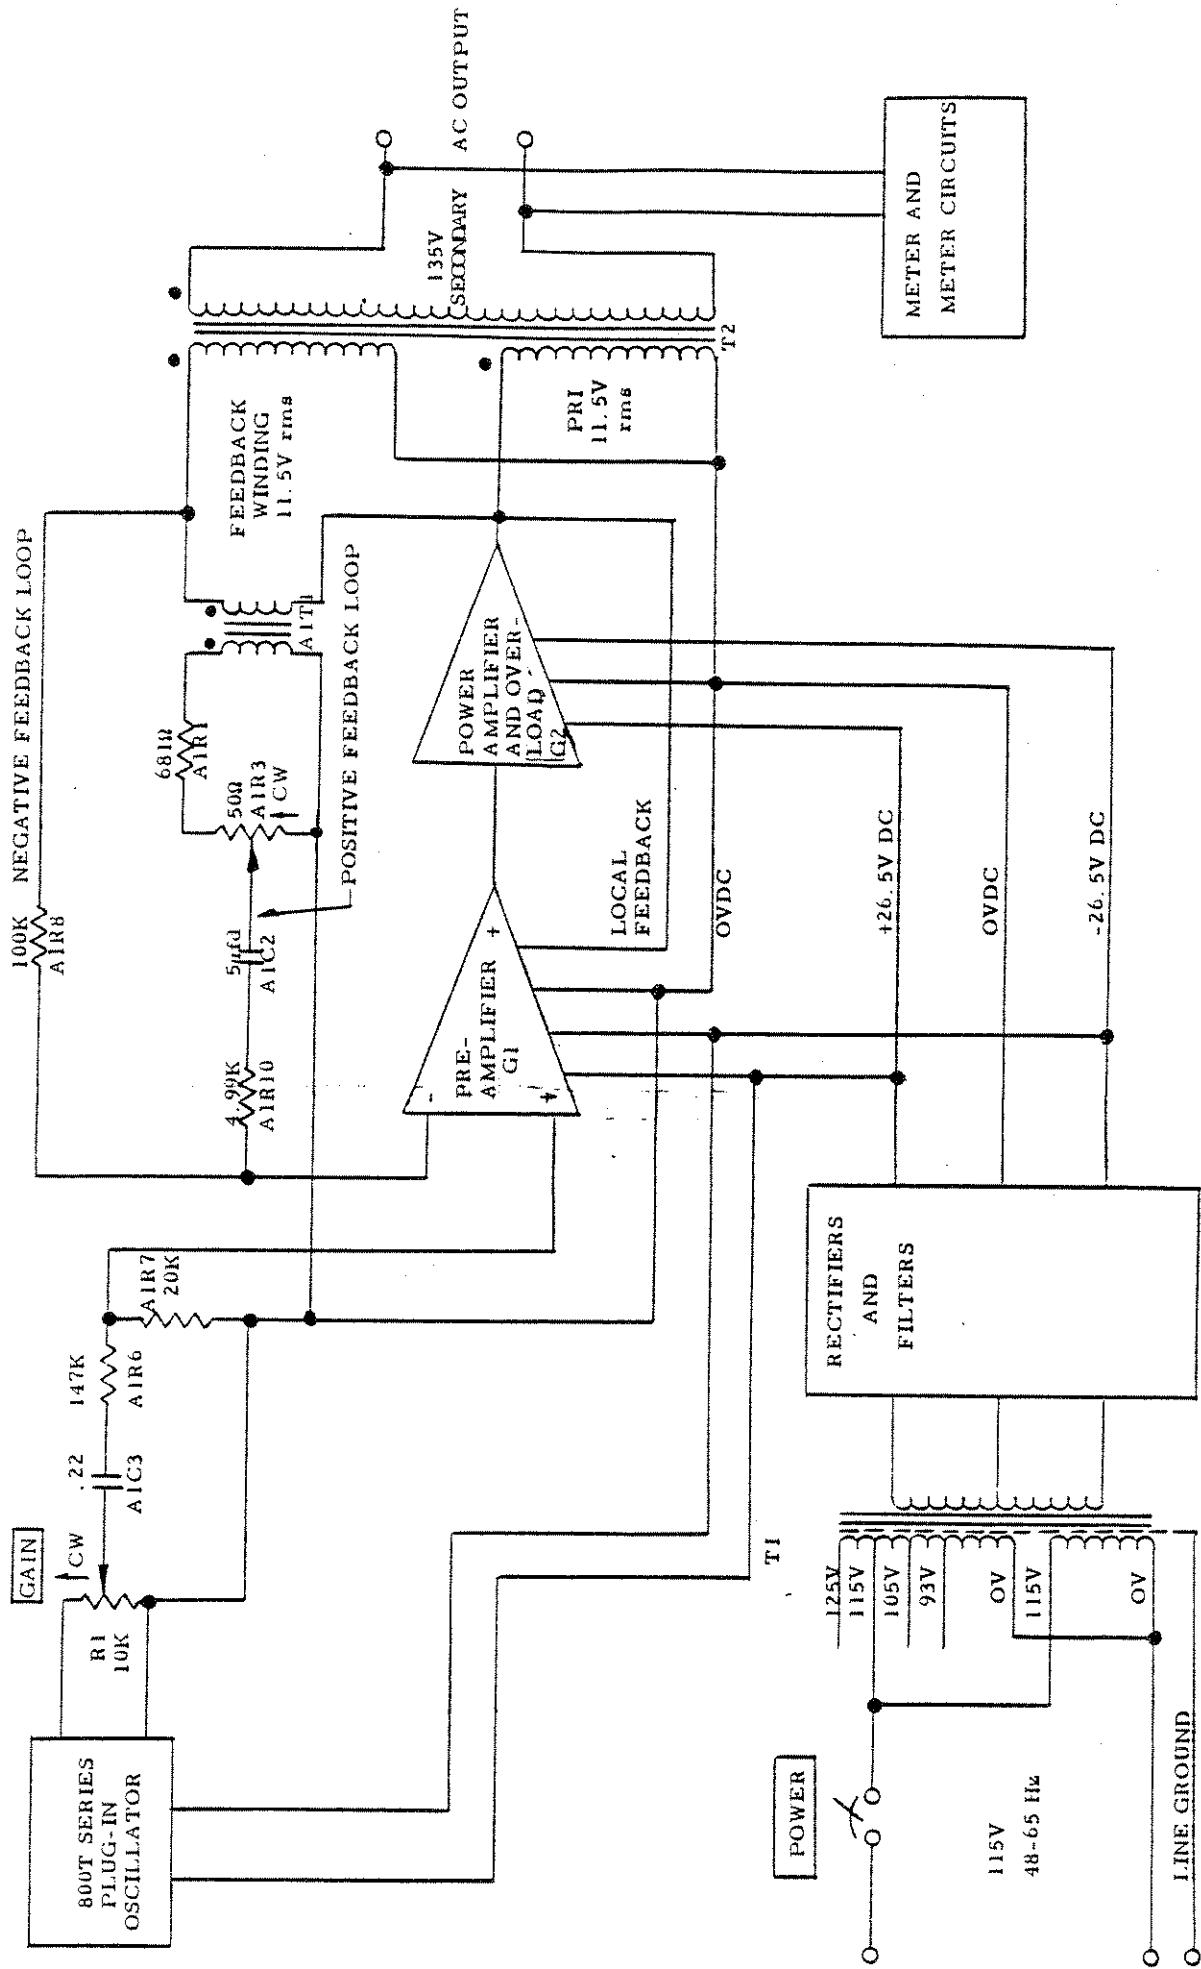

FIGURE 3-1. BLOCK DIAGRAM OF MODEL 101T POWER SOURCE

### 3.2.1 PRE-AMPLIFIER

The pre-amplifier G1 is a part of the A1 assembly and consists of transistors A1Q1 through A1Q6 and associated components connected as a direct coupled differential amplifier. The open loop gain of this pre-amplifier is approximately 30 at 400 Hz and rolls off at 6 dB per octave above 30 KHz.

Transistor A1Q1 is a dual field effect transistor used in the differential source follower configuration to provide a high input impedance and a gain of approximately 1.0. Potentiometer A1R14 is used to adjust the DC bias at the primary of T2 to zero volts with no signal.

Transistor A1Q2 is a dual transistor used in a differential configuration and provides a gain of approximately 15 at 400 Hz. Capacitor A1C7 and resistor A1R24 provide a high frequency step roll off from 30 KHz to 300 KHz.

Transistor A1Q3 and associated components are connected as a constant current source which provides the emitter current for A1Q2. This current source is designed to sink 2 milliamperes from the junction of A1R17 and A1R18 to the -15 volt supply.

Transistors A1Q4, A1Q5 are used in the differential amplifier configuration and provide an open loop gain of 2 at 400 Hz.

Transistor A1Q6 and associated components are connected as a constant current source which provides 6 milliamperes to the junction of A1R23 and A1R25.

### 3.2.2 POWER AMPLIFIER

The power amplifier G2 mechanically consist of the remainder of the A1 board and the A2 assembly. Electrically, the power amplifier consist of transistors A1Q7 through A1Q11A and A2Q1 through A2Q3A and associated components.

Transistor A1Q7 and associated components are connected as a constant current source which provides 22 milliamperes to bias the output stage by means of diodes A1CR6 and A1CR7. This allows the output stage to operate as a Class A amplifier for no load or low VA load conditions and to operate nearly as a Class B amplifier for large load conditions.

Transistor A1Q8 and associated components are connected in the ground emitter configuration. Local negative feedback is provided by A1C10, A1C11, A1R42 and A1R43. The local feedback limits the gain of this stage to 24 at 400 Hz. The gain falls off at 6 dB per octave above 30 KHz.

The positive polarity output amplifier is contained on the A2 assembly and consist of A2Q1 through A2Q3 connected as emitter followers. These transistors supply a total of 16 amperes peak during the positive one-half cycle of the output wave form when the power source is loaded to 100 VA output at 78 per cent of rated output voltage (worst case condition within specification limits). These positive output amplifier transistors and their associated heatsink can dissipate over 100 watts with less than a 35°C case temperature rise with an air flow of 10 cfm per heatsink.

The negative polarity output amplifier is contained on the A1 assembly and consist of A1Q9 through A1Q11 connected in the quasi complementary symmetry configuration. These transistors supply a total of 16 amperes peak during the negative one-half cycle of the output wave form when the power source is loaded to 100 VA output at 78 per cent of rated output voltage (worst case condition within specification limits). These negative output amplifier transistors and their associated heatsinks can dissipate over 100 watts with less than a 35°C case temperature rise with an air flow of 10 cfm per heatsink.

The rated VA output of the power source is, to a large extent, determined by the power dissipation in the quasi complementary symmetry output stage. This power dissipation is determined by the power factor of the load, the output VA level of the amplifier, and to the actual output voltage expressed as percentage of the rated output voltage. The derating chart, given in the specifications, expresses this derating in a graphical form.

When the power source is delivering its full rated output voltage, the primary of the output transformer has an 11.5 volt rms signal.

### 3.2.3 OVERLOAD PROTECTION

The overload protection circuitry is also shown in drawing E4010-070 and consist of zener diode A1CR13, diode A1CR6, A1CR7 and emitter resistors A2R2, A2R3, A1R48 and A1R49.

Diode A1CR13 is used in the zener mode to limit the positive voltage drive to the positive polarity output amplifier (assembly A2) during periods of overload or short circuit. This in turn, limits the output current of the positive polarity output amplifier as determined by the value of emitter resistors A2R2 and A2R3.

Diodes A1CR13 and A1CR7 are used in the normal forward biased mode to limit the negative voltage drive to A1Q9 during

periods of overload or short circuit. This, in turn, limits the collector current available from A1Q9 as determined by the value of emitter resistors A1R48 and A1R49. Since the base drive to A1Q10 and A1Q11 is limited, the corresponding collector current from A1Q10 and A1Q11 will also be limited. Resistor A1R49 is selected to provide symmetrical limiting for both the positive and the negative polarity output amplifiers.

### 3.2.4 OVERALL NEGATIVE FEEDBACK

The overall negative feedback loop is a single-ended potentiometric feedback loop taken from the negative feedback winding of T2 back to the gate of A1Q1B. The feedback network consists of A1R8, A1R9, A1R10, A1C2 and A1C4 and limits the mid-band closed loop voltage gain of the amplifier to 20 from the gate of A1Q1A to the primary of T2.

This overall feedback loop provides approximately 30 dB of negative feedback over the range from 45 Hz to 20 KHz. The feedback rolls off at approximately 9 dB per octave for frequencies greater than 20 KHz. The purpose of this feedback loop is to insure that the frequency response, distortion, gain and amplitude stability specifications are met and/or exceeded.

A low frequency negative feedback loop is taken from the power primary winding of T2 back to the gate of A1Q1B through A1R11 and A1R12. This loop limits the closed loop voltage gain of the amplifier to 1.6 at DC and thereby provides improved DC bias stability for the amplifier.

### 3.2.5 POSITIVE CURRENT FEEDBACK

The positive current feedback loop generates a positive feedback voltage proportional to the load current in the secondary of T2. This is accomplished in the following fashion:

The load current in the secondary of the output transformer T2 is reflected back into the power primary winding producing an IR drop across the power primary winding. The negative feedback winding is connected so as to buck out the  $L_{dt}$  drop in the power primary winding. The remaining differential signal is applied to the primary of transformer A1T1 and converted into a single-ended signal at the secondary of A1T1. This signal is then applied to the gate of A1Q1B through a divider network consisting of A1R1, A1R2, A1R3, A1R10, A1C1 and A1C2. Potentiometer A1R3, which is accessible from the top of A1 printed circuit board, is used to adjust the amount of positive feedback and thereby adjust the output impedance of the power source.

### **3.2.6 POWER SUPPLY**

A schematic diagram for the DC power supply is also a part of drawing E4010-070. This power supply delivers  $\pm 26.5$  volts  $\pm 5$  per cent at 4 amperes DC with less than 2 volts peak-to-peak ripple from the 115 volt 60Hz AC line. These unregulated supplies consist of quad rectifier diode CR1 and filter capacitors C1 and C2 connected in a conventional fashion.

### **3.2.7 FRONT PANEL METER**

The front panel meter M1 has a full scale sensitivity of 0 to 1 millampere DC and an internal resistance of approximately 100 ohms. The meter has a single scale with a range of 0 to 160 volts AC. The meter rectifiers and scaling circuitry are a part of the A1 assembly. This meter circuitry consist of rectifier diodes A1CR8 through A1CR11, potentiometer A1R39, and resistors A1R38, A1R47 and A1R52. The four rectifier diodes are connected so as to form a full wave bridge rectifier. Potentiometer A1R39 is used to shunt a small portion of the meter current and thereby provide a full scale sensitivity adjustment.

## **WARNING**

Voltages up to 250 VAC are available in certain sections of this power source. This equipment generates potentially lethal voltages.

## **DEATH**

on contact may result if personnel fail to observe safety precautions. Do not touch electronic circuits when power is applied. Avoid contact with pin C and pin D of the plug in oscillator, the primary power circuits, and the output circuits of the power source.

## CALIBRATION PROCEDURE

### 4.1 GENERAL

The following calibration procedure, or any part of it, may be performed on a routine basis to insure that the Model 101T Power Source remains within specified tolerance. This procedure should always be performed after any repairs have been made to the unit. This procedure also covers test methods for the following power source adjustments and specifications:

- a) Initial Adjustments
- b) AC Line Input Power and Overload Adjustment
- c) Voltage, Power Output, and Harmonic Distortion
- d) Line Regulation
- e) Load Regulation Adjustment
- f) Amplitude Stability
- g) Frequency Response
- h) AC Noise Level
- i) 0.7 Lagging Power Factor
- j) 0.7 Leading Power Factor

This calibration procedure assumes that the power source will be operated from the 115 volt, 47 to 65 Hz AC line. For higher values of AC line voltage, a 240 volt variac and a 240 volt wattmeter must be substituted for those called out in this procedure. Consult Section 2.2.1 of this instruction manual for operation from other than the 115 volt AC line.

Table 4-1 below illustrates the measurement voltage and impedance level when evaluating the output of the power source.

TABLE 4-1

Rated Output Voltage	135V AC
78% of Rated Output Voltage	105V AC
Resistive Load for 100 VA Output at Rated Output Voltage	182Ω
Resistive Load for 100 VA Output at 78% of Rated Output Voltage	110Ω

Section 2.8 indicates some potential problems associated with output wiring IR drop. When checking load regulation and amplitude stability, care should be taken to use a four-wire connection such that the external load and the measurement equipment have completely separate wiring from the large binding posts at the rear of the power source.

#### 4.2

#### TEST EQUIPMENT REQUIRED

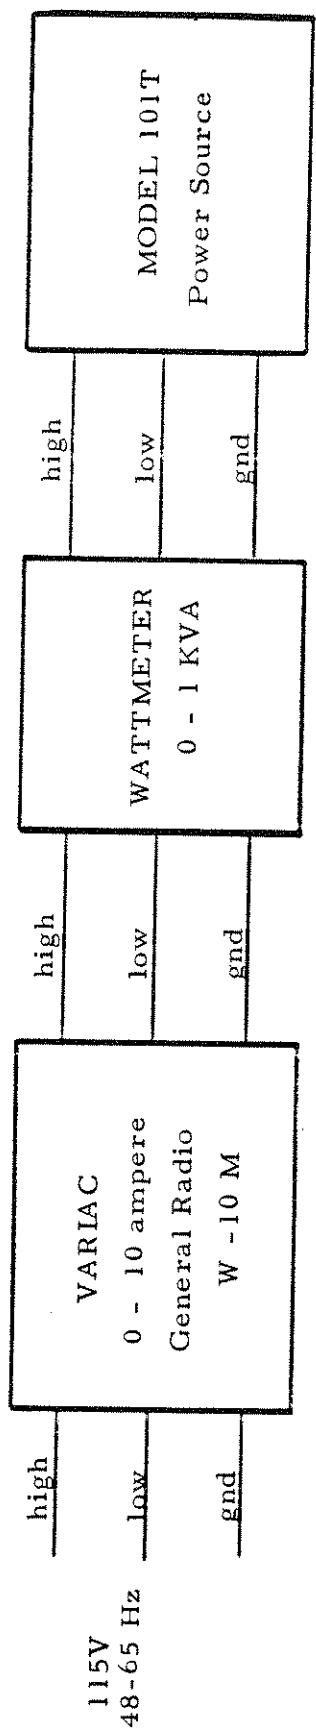

The following test equipment is required to perform the calibration procedure assuming that the input line voltage has a nominal value of 115 volts rms. Some equipment substitutions will be required if this is not the case.

- a) Oscilloscope, Tektronix 533A with "W" plug-in
- b) 1.0KVA Variac, General Radio W10M or equivalent
- c) 1.0 KVA Wattmeter, Simpson Electric or equivalent
- d) Distortion Analyser, H.P. 330B or equivalent
- e) Differential Voltmeter, Fluke 883A or equivalent
- f) Multi-range 100 watt load box, or individual 100 watt power resistors, as defined in Table 4-1. Dale type NHL or equivalent
- g) Expanded Scale (about 115 VAC) strip chart recorder, Voltron Model 89.038 or equivalent
- h) Multimeter, Simpson 260 equivalent

#### 4.3

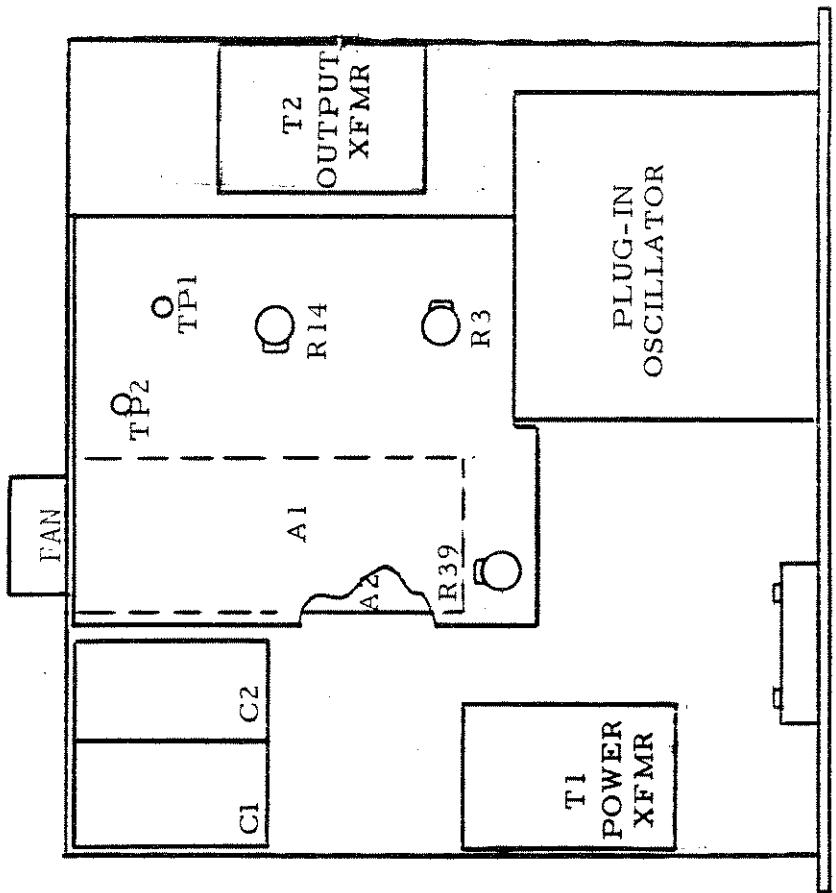

#### INITIAL ADJUSTMENTS

- 4.3.1 Connect the Model 101T Power Source as shown in Figure 4-1. Turn the GAIN control fully counter-clockwise. Adjust the line voltage to its nominal value with the variac. Turn the POWER switch "on." The wattmeter should indicate 60 watts or less at nominal line voltage. If a problem is encountered, perform step 4.3.2 below.
- 4.3.2 Remove the top cover from the unit and connect the differential voltmeter between terminal 1 and terminal 2 of T2. Adjust potentiometer A1R14 so that the DC voltage across the primary of T2 is 0.00 volts  $\pm$ 5 millivolts.
- 4.3.3 Connect the differential voltmeter to the power output terminals at the rear of the unit. Adjust the GAIN control for a 135 volt output with the oscillator set to 400 Hz. Adjust the meter calibration control A1R39 so that the front panel meter and the differential voltmeter correlate within one per cent of each other. Vary the frequency from 45 Hz to 10 KHz and check that the front panel meter reads within  $\pm$ 3 per cent of the correct value.

See Table 2-1 for AC line input wiring  
to the Model 101T Power Source. Unit  
is normally wired for 105 to 125 volt  
AC line operation.

FIGURE 4-1. Test set up for initial adjustments of Model 101T Power Source.

TOP VIEW

FIGURE 4-2. INTERNAL ADJUSTMENTS FOR MODEL 101T POWER SOURCE

- 4.4 AC LINE INPUT POWER and OVERLOAD ADJUSTMENT
- 4.4.1 Connect the Model 101T Power Source as shown in Figure 4-3. Adjust the output voltage of the power source to 105 volts rms (78 per cent of rated output voltage) at 400 Hz. Close switch S2 (110 ohm load) and readjust the output voltage slightly, if required, in order to maintain a 105 volt output. The power source should deliver a clean sine wave output with less than 0.30 per cent distortion. Vary the frequency from 45 Hz to 10 KHz and check that the distortion does not exceed 0.50 per cent over the AC input line voltage range of 105 to 125 volts while maintaining the output voltage at 105 volts rms. Select zener diode A1CR13 so that no clipping or excessive distortion occurs on the positive peak of the output wave form under worst case conditions outlined above. Select resistor A1R49 so that no clipping or excessive distortion occurs on the negative peak of the output wave form under worst case conditions outlined above.
- 4.4.2 With the AC input line voltage adjusted to its maximum value (normally 125 volts AC), close switch S2 and set the output voltage to 105 volts rms at 400 Hz. The AC line wattmeter should indicate less than 400 watts.
- 4.4.3 Repeat step 4.4.2 except open switch S2 (no load on output of power source). The AC line wattmeter should indicate less than 100 watts with a line voltage of 125 volts rms.
- 4.5 VOLTAGE, POWER OUTPUT and HARMONIC DISTORTION
- 4.5.1 Connect the Model 101T Power Source as shown in Figure 4-3. Adjust the variac to provide a 115 VAC line input and allow the power source to warm up for a few minutes. Set the oscillator output to 400 Hz and adjust the output of the amplifier with the GAIN control to provide 135 volts rms (100% of rated output). Close switch S1 so that the 182 ohm load is across the output of the power source.
- 4.5.2 Vary the AC line voltage from 105 to 125 volts with the variac and check that no significant clipping is observed on the sine wave output with the oscilloscope. The harmonic distortion must be less than 0.3 per cent over the full line voltage range.
- 4.5.3 Set the oscillator output to 45 Hz and adjust the output of the power source to 135 volts rms with the GAIN control. Repeat step 4.5.2. The harmonic distortion must be less than 0.50 per cent over the full line voltage range.
- 4.5.4 Set the oscillator output to 1 KHz and adjust the output of the power source to 135 volts rms with the GAIN control. Repeat step 4.5.2. The harmonic distortion must be less than 0.30 per cent over the full line voltage range.

- 4.5.5 Set the oscillator output to 10 KHz and adjust the output of the power source to 135 volts rms with the GAIN control. Repeat step 4.5.2. The harmonic distortion must be less than 0.50 per cent over the full line voltage range.
- 4.5.6 Repeat steps 4.5.1 through 4.5.5 except set the output of the power source to 105 volts rms (78% of rated output) and close switch S2 instead of S1. The harmonic distortion must be less than 0.30 per cent from 200 Hz to 1 KHz, and less than 0.50 per cent from 45 Hz to 10 KHz.

#### 4.6 LINE REGULATION

- 4.6.1 Connect the Model 101T Power Source as shown in Figure 4-3. Set the oscillator frequency to 400 Hz. Close switch S1 (182 ohm load) and adjust the output of the power amplifier to 135 volts rms (100 per cent of rated output voltage) at 400 Hz.
- 4.6.2 Vary the line voltage from 105 volts to 125 volts AC and measure the change in output voltage of the power amplifier. This change should be less than .68 volts rms.
- 4.6.3 Set the frequency of the oscillator to 45 Hz and repeat 4.6.1 and 4.6.2. The change in the output voltage should be less than .68 volts rms.
- 4.6.4 Set the frequency of the oscillator to 10 KHz and close switch S1. Repeat step 4.6.2. The change in output voltage should be less than .68 volts rms.

#### 4.7 LOAD REGULATION ADJUSTMENT

The load regulation adjustment is accessible after the top cover of the Model 101T Power Source has been removed. This adjustment is usually set for zero regulation at 400 Hz.

- 4.7.1 Connect the Model 101T Power Source as shown in Figure 4-3. Check that the load is connected to the large red and white binding posts at the rear of the power source. The output voltage may be monitored either at the rear or the front of the power source. If it is monitored at the rear of the power source, care should be taken to use four-wire sensing. Adjust the output voltage of the Model 101T Power Source to 105 V rms output (or 78 per cent of rated output voltage) at 400 Hz.
- 4.7.2 Place the differential voltmeter on the 1000 volt AC range and connect it across the front panel output terminals of the power source. Adjust A1R3 so that the output voltage variation is less than 100 millivolts as the 110 ohm load is added and removed. Maintain the line voltage at 115 volts during this test.

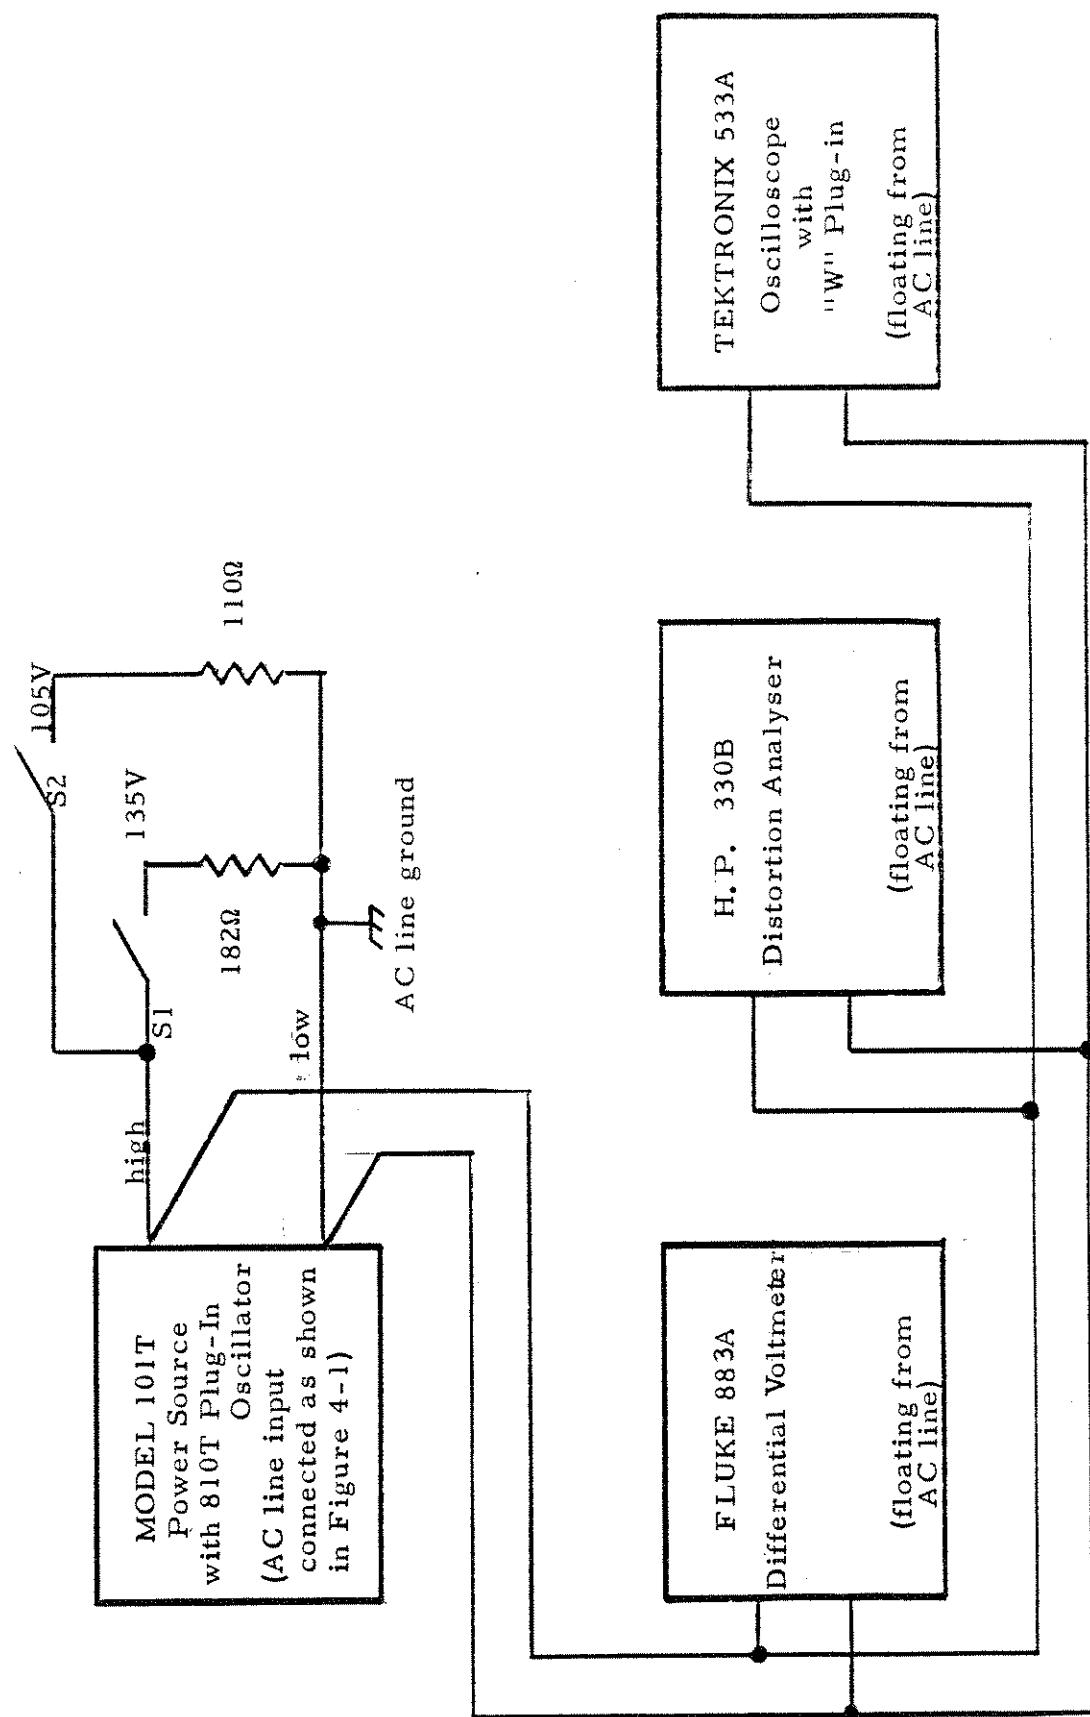

FIGURE 4-3. Test circuit for Model 101T Power Source

- 4.7.3 Set the frequency of the oscillator to 5 KHz. Adjust the output amplitude of the power source to 105 volts rms with no load on the output of the power source. The output of the power source should change less than  $\pm 1.05$  volts when loaded with the 110 ohm resistor. Maintain the line voltage at 115 volts during this test.
- 4.7.4 Set the frequency of the oscillator to 45 Hz and repeat 4.7.3. The output of the power source should change less than  $\pm 1.05$  volts.
- 4.7.5 Set the frequency of the oscillator to 10 KHz and repeat 4.7.3. The output of the power source should change less than  $\pm 2.10$  volts. Capacitor A1C1, in the secondary circuit of A1T1, has been set at the factory for optimum load regulation at 10 KHz and may be changed if required. Care should be taken to use non-inductive load resistors since load impedances are fairly low and a few micro henrys of inductance will significantly influence the power factor at 10 KHz.

#### NOTE

Care should be taken to insure that the output amplitude of the oscillator remains stable and independent of load conditions during this test.

### 4.8 AMPLITUDE STABILITY

- 4.8.1 Connect the Model 101T Power Source as shown in Figure 4-3. Adjust the AC input line voltage to 115 volts rms. Adjust the output of the power source to provide 115 volts rms output (85.3 per cent of rated output voltage) at 400 Hz. Connect a 132 ohm (100 VA) load to the output terminals at the rear of the power source and check that the regulation control has been set to provide a zero output impedance.
- 4.8.2 Connect an AC expanded scale (about 115 volts rms) strip chart recorder across the output terminals of the power source and record the drift during a 24 hour period. This drift should be less than  $\pm .29$  volts rms. Disregard the drift during the first hour, as this represents initial warm-up drift. Care should be taken to insure that the ambient temperature is held constant at  $\pm 3$  degrees C for this test.

### 4.9 FREQUENCY RESPONSE

- 4.9.1 Connect the Model 101T Power Source as shown in Figure 4-3. Adjust the input AC line voltage to 115 volts rms. Adjust the output of the power source to provide 135 volts output (100 per cent of rated output voltage) at 400 Hz.
- 4.9.2 Vary the output frequency of the oscillator from 45 Hz to 10 KHz and monitor the output voltage of the power source

with a differential voltmeter under no-load conditions. The output of the power source should vary less than  $\pm 8.0$  volts rms from 45 Hz to 10 KHz.

- 4.9.3 Close switch S1 and repeat 4.9.1 and 4.9.2. The output of the power source should vary less than  $\pm 8.0$  volts rms for 45 Hz to 10 KHz.

#### 4.10 AC NOISE LEVEL

- 4.10.1 Connect the Model 101T Power Source as shown in Figure 4-3. Adjust the line voltage to 115 volts rms. Adjust the output of the power source to provide 105 volts rms. (78% of rated output voltage) at 400 Hz.

- 4.10.2 Close switch S2 and monitor the output of the power source with the Tektronix 533A Oscilloscope with a "W" plug-in. Using the offset feature of the "W" plug-in, observe the positive peak of the output voltage at a vertical sensitivity of .2 volt per centimeter and a sweep rate of 5 milliseconds per centimeter. The peak-to-peak noise and ripple should not exceed 0.093 volts (70 dB below full output). The noise and ripple output may be slightly greater if the power source is tested at an output frequency of less than 200Hz.

- 4.10.3 Remove the plug-in oscillator and short pins 1 and 2 together of the small 12 pin terminal strip TB1 located on the rear panel of the Model 101T. The AC rms noise in the output should now be less than 10.5 millivolts rms (80 dB below full output) when read on the differential voltmeter. Remove the short from pins 1 and 2 of the TB1 and then insert the plug-in oscillator into the 101T.

#### 4.11 0.7 LAGGING POWER FACTOR

- 4.11.1 Connect the Model 101T Power Source as shown in Figure 4-3. Figure 4-4 illustrates the load circuit and gives load parameter values for 100 VA 0.7 power factor at 400 Hz with 78 per cent of rated output voltage from the power source. This represents the worst case inductive load for maximum power dissipation inside the power source.

- 4.11.2 Set the oscillator frequency to 400 Hz and adjust the GAIN control for 78 per cent of rated output voltage. Check that the power source produces a stable output with no high-frequency oscillation or excessive distortion. Refer to Section 4.5 of this instruction manual for the procedure to measure harmonic distortion. This distortion must be less than 0.3 per cent at 400 Hz.

- 4.11.3 The regulation control usually does not require significant readjustment in order to provide a zero regulation with a 0.7 power factor load at 400 Hz. If the unit is to be operated at a 0.7 power factor in the high frequency region, i.e., 2KHz to 10KHz, then it may be necessary to readjust the regulation control. In this case, rotate the regulation control until zero regulation is obtained at the specific frequency and load condition.

- 4.11.4 The AC line input power is 400 watts maximum with an 0.7 power factor load at 78 percent of rated output voltage and an input line voltage of 125 volts rms.
- 4.11.5 The above tests may be repeated at frequencies other than 400Hz provided that the inductance of the series inductor is changed inversely proportional to the absolute value to the test frequency. For example, at 1KHz, the inductance value must be divided by 2.5. The series resistance value remains unchanged.
- 4.12 0.7 LEADING POWER FACTOR
- 4.12.1 Connect the Model 101T Power Source as shown in Figure 4-3. Figure 4-5 illustrates the load circuit and gives load parameter values for 100 VA, 0.7 power factor operation at 400Hz with 78 percent of rated output voltage from the power source. This represents the worst case capacitive load for maximum power dissipation inside the power source.
- 4.12.2 Set the oscillator frequency to 400Hz and adjust the GAIN control for 78 percent of rated output voltage. Check that the power source produces a stable output with no high-frequency oscillation or excessive distortion. Refer to Section 4.5 of this instruction manual for the procedure to measure harmonic distortion. This distortion must be less than 0.3 percent at 400Hz.
- 4.12.3 The regulation control usually does not require significant readjustment in order to provide zero regulation with a 0.7 power factor load at 400Hz. If the unit is to be operated at 0.7 power factor in the high frequency region, i.e., 2KHz to 10KHz, then it may be necessary to readjust the regulation control until zero regulation is obtained at the specific frequency and load condition.
- 4.12.4 The AC line input power is 400 watts maximum with an 0.7 power factor load at rated output voltage and an input line voltage of 125 volts rms.
- 4.12.5 The above tests may be repeated at frequencies other than 400Hz, provided that the capacitance of the series capacitor is changed inversely proportional to the absolute value of the test frequency. For example, at 1KHz, the capacitance value must be divided by 2.5. The series resistance value remains unchanged.

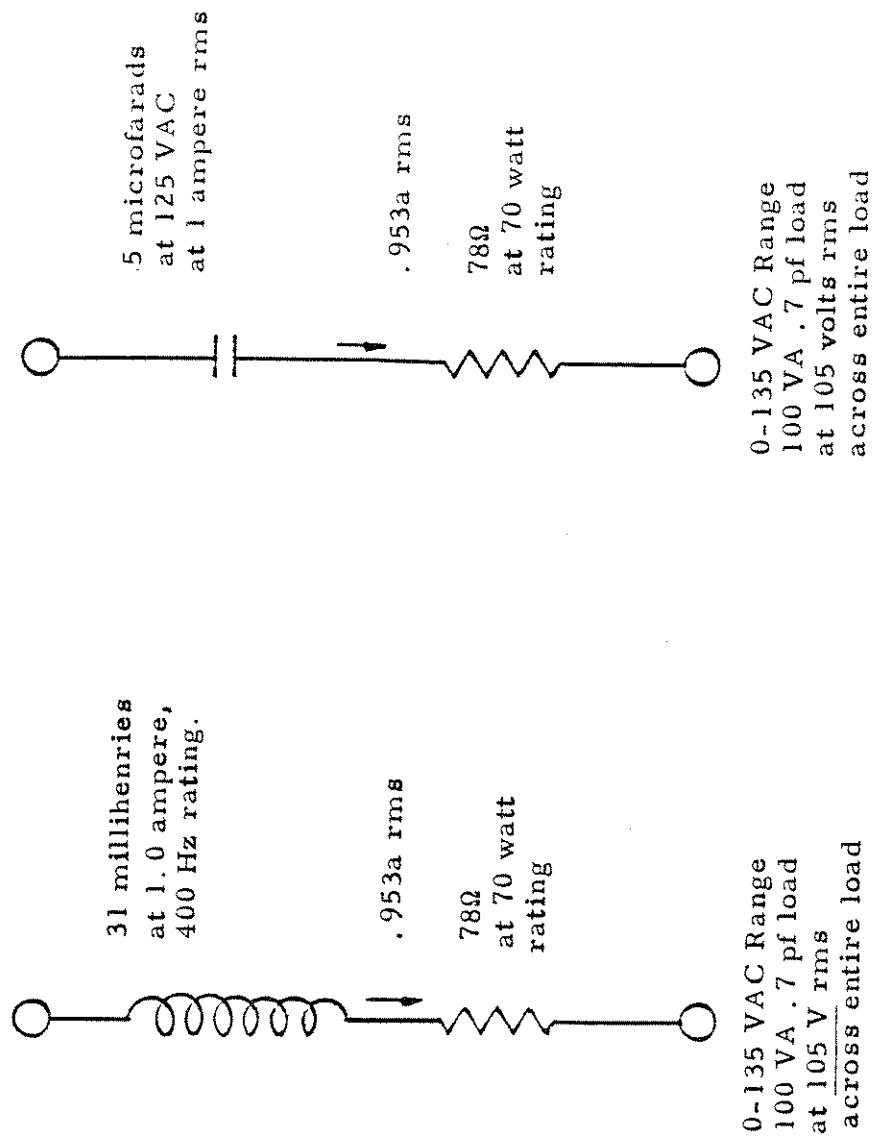

FIGURE 4-4. Circuit for 100VA, 0.7 Lagging Power Factor Load at 400 Hz.

FIGURE 4-5. Circuit for 100VA, 0.7 Leading Power Factor Load at 400 Hz.

## MAINTENANCE AND TROUBLESHOOTING

### 5.1 GENERAL

The California Instruments Model 101T Power Source is a solid state unit and should require a minimum of maintenance. However, it is forced air cooled and will accumulate some dust with time. The power transistor heatsinks should receive a forced air bath at intervals not to exceed 6 months.

#### CAUTION

Failure to keep the heatsinks clean will reduce their thermal transfer efficiency somewhat and could cause failure of the power source.

### 5.2 TROUBLESHOOTING

- 5.2.1 If a problem appears in the power source, it must be isolated to a specific section of the unit. Before servicing the amplifier, check that the AC power input to the unit is of the proper amplitude and frequency. Check that the signal input to the power amplifier is also of the proper amplitude (approximately 5 volts rms) and frequency (45 Hz to 10 KHz). Check that the output load on the power amplifier is not excessive or that the load starting transients are not excessive. Check that the output of the oscillator is coupled to the input of the power amplifier through the 12 pin connector on the rear of the power amplifier.
- 5.2.2 If the problem has been resolved to be in the power amplifier, first check all DC power supply voltages. Information concerning power supply ripple and voltage tolerance is given in section 3.2.6 of this instruction manual.
- 5.2.3 Check that the quasi complementary symmetry output amplifier is operating properly and is not drawing excessive current under no load conditions. Section 3.2.2 of this instruction manual describes the operation of this output amplifier.
- 5.2.4 Check that the overload circuitry is operating properly. The overload circuit may be disabled by removing A1CR13.
- 5.2.5 If the problem has been resolved to be in the oscillator, consult the applicable oscillator instruction manual.

## CIRCUIT DIAGRAM

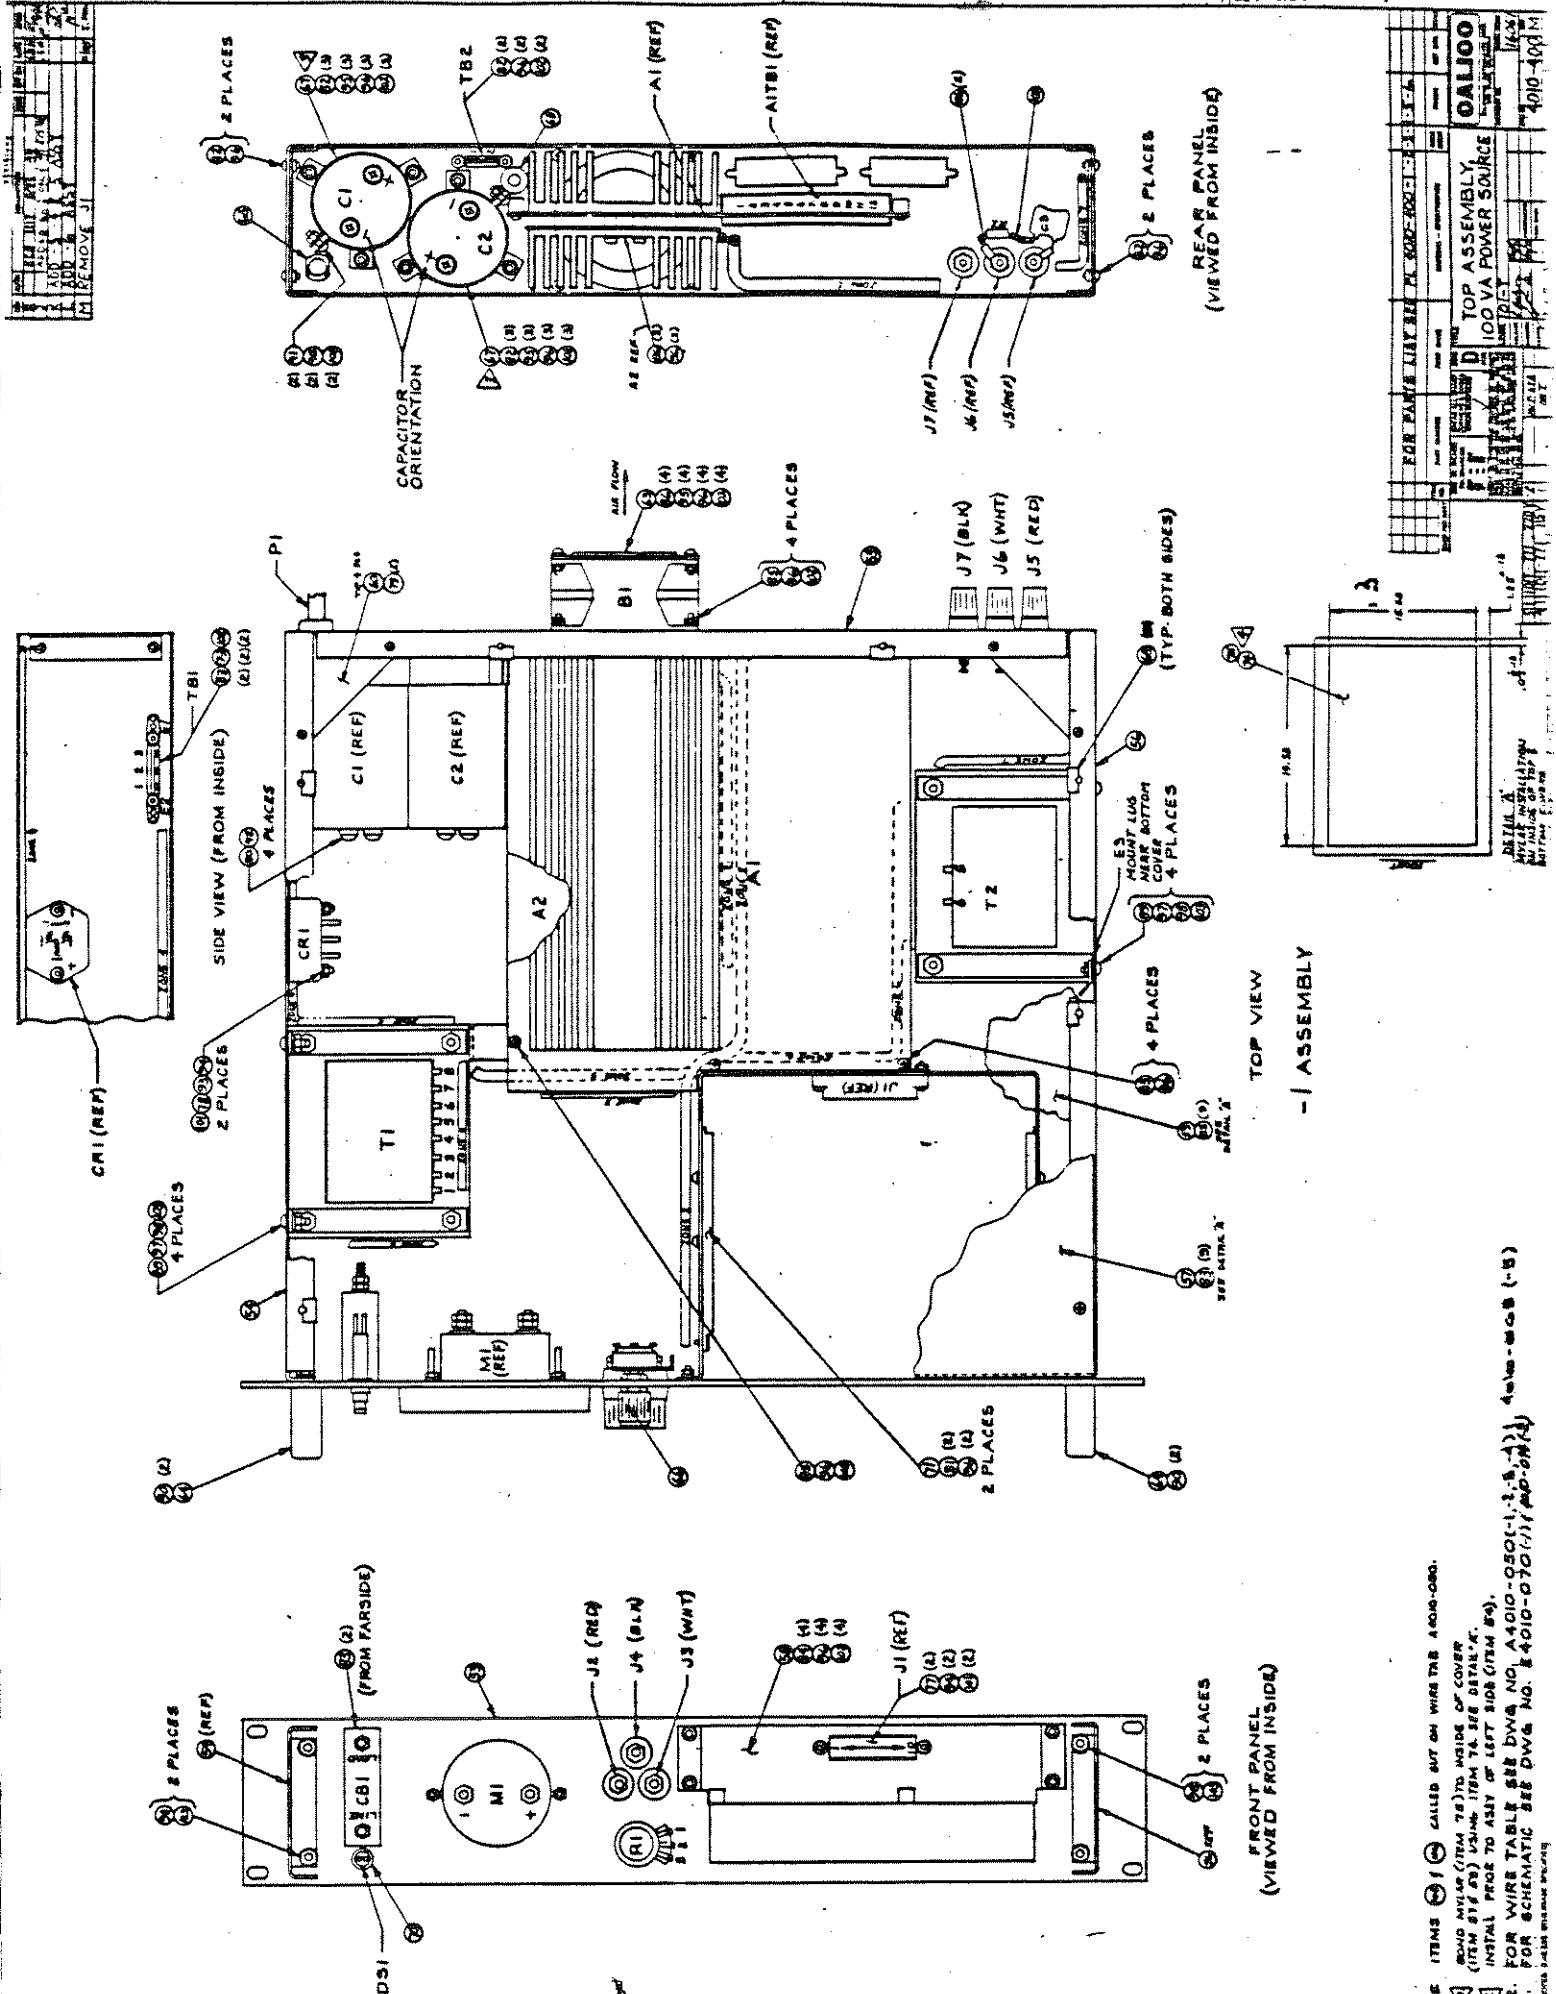

### 6.1 GENERAL

This section contains schematics and mechanical diagrams necessary for operation and maintenance of the Model 101T AC Power Source. The schematic diagrams illustrate the circuit while the mechanical assemblies indicate the part placement.

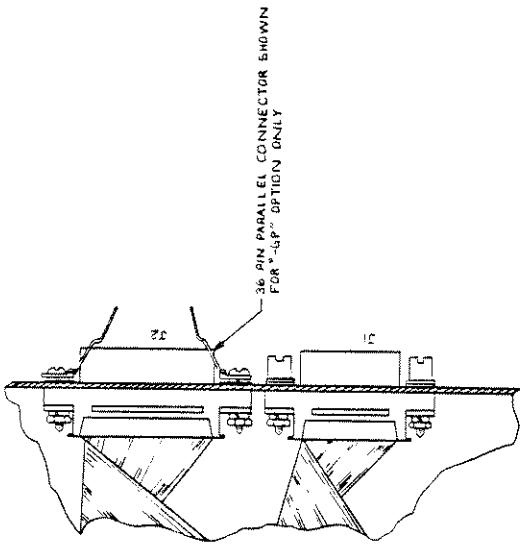

### 6.2 REFERENCE DESIGNATIONS

Partial reference designators are shown on schematic and mechanical drawings. Prefix these reference designators with assembly and/or sub-assembly designation for the complete reference designator. For example:

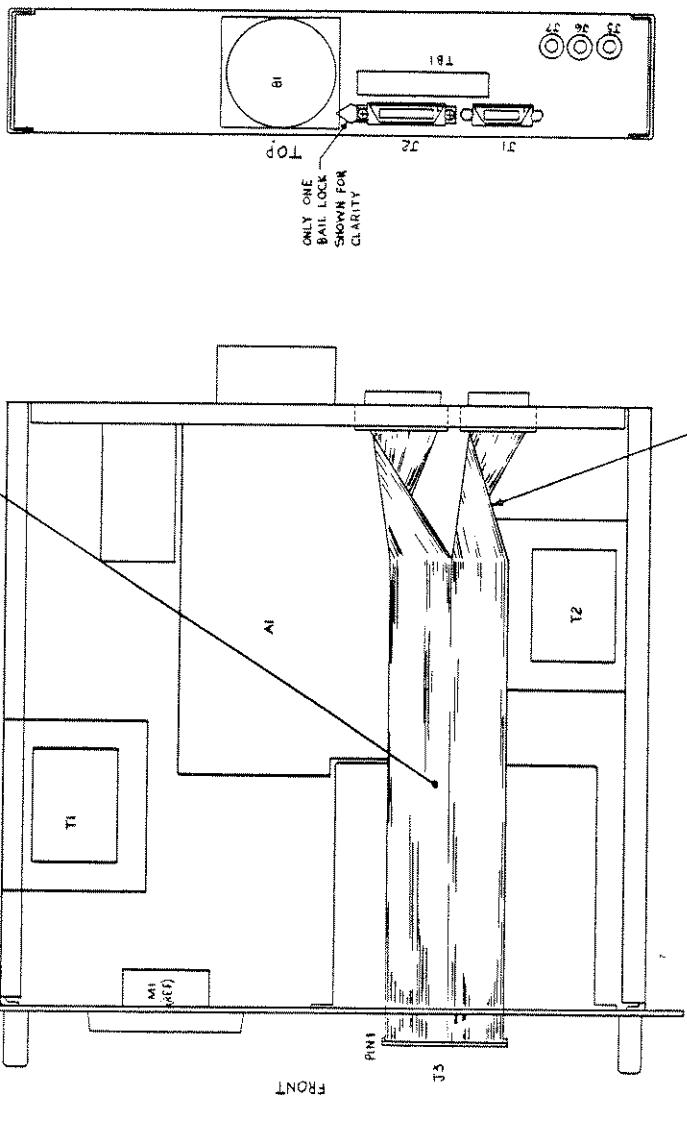

Assembly/Sub-Assembly	Component	Component Designation
A1	C14	A1C14
None	T1	T1
A2	R1	A2R1

## SECTION 7

### REPLACEABLE PARTS

#### 7.1 GENERAL

This section contains ordering information and a complete list of replaceable parts. The parts are listed by their major assembly in alpha-numeric order by their reference designators. The list includes the parts description, manufacturers' identification (see Appendix A for list of manufacturers), and California Instruments' part numbers.

#### 7.2 ORDERING INFORMATION

In order to ensure prompt, accurate service, please provide the following information, when applicable, for each replacement part ordered.

- a. Model number and serial number of the instrument.
- b. California Instruments part number for the sub-assembly where component is located (PARENT ITEM NO.).
- c. Component reference designator (SEQ NO.).
- d. Component description (DESCRIPTION TRUNCATED).
- e. Component manufacturer's FSCM number (VENDOR).
- f. California Instruments part number (COMPONENT ITEM NO.).

A further explanation of these terms can be found in Section 7.3.

All replacement part orders should be addressed to:

California Instruments  
Attention: Parts Department  
9025 Balboa Avenue  
San Diego, California 92123-1509

## 7.3 COMPUTER GENERATED PARTS LISTS

The following information is included as an explanation of the computer formatted parts list column.

- 7.3.1 "Seq. No." - Sequence number; the reference designator or the component, or (if there is no reference designator) the balloon number (bubble or "find" number) on the face of the assembly drawing or the top assembly drawing. They are listed in alpha-numerical order.
- 7.3.2 "Component Item No." - This is California Instruments part number. Please use this number when ordering spares.
- 7.3.3 "Description, Truncated" - A brief description of the item. Abbreviations are per MIL-STD-12 or industry accepted standards.
- 7.3.4 "Engineering Drawing No." - This is used for one of the following:
  - a) The document/specification number generated by California Instruments to control the part.
  - b) The generic part number (military specification or industry accepted standard).
  - c) The primary vendor's catalog part number. An asterisk at the end of the number indicates number is longer than that shown (contact California Instruments if the full number is required).
- 7.3.5 "Vendor" - This is the FSCM code identification (see Appendix A).
- 7.3.6 "Quan" and "U/M" - The requirements per unit of measure such as: "2 each"; "1 lb."; "4 oz."; or "6 SI" (square inches).

MANUAL ADDENDUM

Model 101T-638

1.0 GENERAL:

The Model 101T-638 AC Power Source is identical to the standard Model 101T AC Power Source except the Model 101T-638 has an output of 0-35 volts rms.

2.0 SPECIFICATIONS:

All specifications are identical to the standard Model 101T except full power is available from 35 volts rms to 27.3 volts (78% of rated output voltage) and a 0 to 40 voltmeter is used in place of the 0 to 160 voltmeter.

3.0 THEORY OF OPERATION:

The theory of operation section given in section 3.0 of the standard 101T manual is applicable except that the output transformer T2 is replaced with an output transformer whose secondary voltage is 35 volts rms rather than 135 volts rms.

4.0 The calibration procedure given in section 4.0 of the standard 101T manual is applicable except that the full load resistance at 35 volts output is 12.25 ohms rather than 182 ohms and that the full load resistance at 78% of rated output voltage is 7.46 ohms rather than 110 ohms. Line regulation, load regulation, amplitude stability, frequency response and AC noise level tests given in section 4.6 through 4.10 of the standard manual are correct except that the load resistance values are changed to 12.25Ω when S1 is closed and 7.46 ohms when S2 is closed. Test data tolerances are further restricted by the ratio of 135V to 35V or 3.85 to 1.

5.0 PARTS LIST:

Parts list 4995-410 defines part substitutions required to the standard Model 101T.

TITLE	100VA AC Power Source 35V Output	SHT 2 OF 2			

MANUAL ADDENDUM

Model 101T-672

1.0 GENERAL:

The Model 101T-672 AC Power Source is identical to the standard Model 101T AC Power Source except the Model 101T-672 AC Power Source has an output of 0-30 volts rms and is tested from 45 Hz to 5 KHz.

2.0 SPECIFICATIONS:

All specifications are identical to the standard Model 101T except full power is available from 30 volts rms to 23.4 volts (78% of rated output voltage) and a 0 to 30 voltmeter is used in place of the 0 to 160 voltmeter. Load regulation and distortion specifications apply for operation at 45 Hz to 5 KHz.

3.0 THEORY OF OPERATION:

The theory of operation section given in section 3.0 of the standard 101T manual is applicable except that the output transformer T2 is replaced with an output transformer whose secondary voltage is 30 volts rms rather than 135 volts rms.

4.0 CALIBRATION PROCEDURE:

The calibration procedure given in section 4.0 of the standard 101T manual is applicable except that the full load resistance at 30 volts output is 9.0 ohms rather than 182 ohms and that the full load resistance at 78% of rated output voltage is 5.46 ohms rather than 110 ohms. Line regulation, load regulation, amplitude stability, frequency response and AC noise level tests given in section 4.6 through 4.10 of the standard manual are correct except that the load resistance values are changed to 9.0 ohms when S1 is closed and 5.46 ohms when S2 is closed. Test data tolerances are further restricted by the ratio of 135V to 30V or 4.50 to 1.

5.0 PARTS LIST:

Parts list 4995-408 defines part substitutions required to the standard Model 101T.

MODEL	101T-672	CALICO P/N 4995-408			ASSY R.D.
TITLE	100 VA AC Power Source 30 V Output	SHT 2 OF 2			

MODEL 101T-771  
MANUAL ADDENDUM

1.0 GENERAL

The Model 101T-771 AC Power Source is identical to the standard Model 101T AC Power Source except the Model 101T-771 has an output of 0 to 270 volts rms.

2.0 SPECIFICATIONS

All specifications are identical to the standard Model 101T except full power is available from 270 volts rms to 210 volts (78% of rated output voltage) and a 0 to 320 voltmeter is used in place of the 0 to 160 voltmeter.

3.0 THEORY OF OPERATION

The theory of operation section given in section 3.0 of the standard 101T manual is applicable except that the output transformer T2 is replaced with an output transformer whose secondary voltage is 270 volts rms rather than 135 volts rms.

4.0 CALIBRATION

The calibration procedure given in section 4.0 of the standard 101T manual is applicable except that the full load resistance at 270 volts output is 729 ohms rather than 182 ohms and that the full load resistance at 78% of rated output voltage is 441 ohms rather than 110 ohms. Line regulation, amplitude stability, frequency response and AC noise level tests given in section 4.6 through 4.10 of the standard manual are correct except that the load resistance values are changed to 729Ω when S1 is closed and 441 ohms when S2 is closed. Load regulation is optimized for 400 Hz and is slightly degraded at higher frequencies. Test data tolerances are further relaxed by the ratio of 135V to 270V or 1 to 2.00.

5.0 PARTS LIST

Parts list 4010-406 defines part substitutions required to the standard Model 101T.

TITLE	AC POWER SOURCE			SHT 2 OF 2	

MANUAL ADDENDUM  
MODEL 101T-3336 AC POWER AMPLIFIER

1.0 GENERAL

The Model 101T-3336 AC Power Source is identical to the standard Model 101T AC Power Source except that a Current Sense Transformer and a Programmable Current Limit PC Board have been added to provide programmable current limit via the IEEE-488 GPIB or the front panel of the 849TA-series Programmable Control Module with the Current Limit option installed.

2.0 SPECIFICATIONS

All specifications for the Model 101T-3336 remain the same as the standard Model 101T AC Power Source except for the following:

SPECIAL FEATURE:

\* PROGRAMMABLE OUTPUT  
CURRENT LIMIT:

Front panel and IEEE-488 Bus programmable output current limit from 10% to 100% of full load output current. Current limit accuracy of 2% of full load current (0.9523 Amps) from 45 Hz to 5.0 KHz.

For Current Limit Programming instructions see Model 849TA Instruction Manual, section 3.5.2.8.

FULL POWER: 45 Hz to 10.0 KHz

DISTORTION: Less than 1% from 45 Hz to 5.0 KHz.

\* Must be used with the 849TA Programmable Controller Module with the Current Limit option installed.

3.0 THEORY OF OPERATION:

The theory of operation remains unchanged from the standard Model 101T. The added Current Sense Transformer and Current Limit PC Board allow the 849TA Programmable Control Module to program the output current limit level. The current limit is programmed in percent of full scale current for the proper output voltage range (0.9523 Amps).

The output power wire is routed through the Current Sense Transformer T101. Full load current (0.9523 Amps) is scaled to 1.00 VAC by burden resistors R101 and R102.

The secondary of A101T1 is connected to the A101 Current Limit PC Board, rectified and compared to the DC programming input voltage (full scale equals 9.766 VDC) from the 849T. The 849TA oscillator output is routed to the A101 board, buffered and routed to the power source Gain Pot. If the output current exceeds the programmed input, the A101 board attenuates the oscillator input from the 849TA until the output current is equal to the programmed value. The A101 is powered from the 115 VAC winding on the primary of the power source Input Transformer T1.

#### NOTES

- 1) This Current Limit Option is intended to protect sensitive loads and DOES NOT PROTECT THE POWER SOURCE FROM DAMAGE IF OPERATED OUTSIDE THE POWER DERATING CURVES found on page iii of the Model 101T Instruction Manual.
- 2) If an 849TA Programmable Control Module is not available to control the Model 101T-3336 the A101 Assembly can be bypassed by switching A101S1-1 to the "ON" position. The power source can be returned to normal operation by moving A101S1-1 to the "OFF" position.

## 4.0 CALIBRATION

The calibration procedure for the Model 101T-3336 remains the same as the standard Model 101T except for the verification of the current limit accuracy. The following steps may be used to test the accuracy of the programmable current limit function that is provided by the 101T-3336 and the A101 assembly.

### 4.1 Set Up For Current Limit Tests

- 1) Turn the power source "OFF"
- 2) If not already accomplished, connect the power source and test circuits as shown in Figure 4-1.
- 3) Turn the power source "ON".
- 4) Set the frequency of the 800T to 400 Hz.

#### 4.2 Test Current Limit

- 1) Set the amplitude of the 800T and 101T-3336 to 105 VAC.
- 2) Set the precision DC Voltage Source to 9.766 VDC.
- 3) Close "S2" on the 100 VA Load Assembly (100% load at 78% output voltage).
- 4) Verify that the power source output current is 0.9523 amps  $\pm 0.02$  amps.
- 5) Open "S2"
- 6) Repeat steps 3-5 with the precision DC Voltage Source set at 4.883 VDC and 0.977 VDC.

#### 4.3 Test Output Voltage Ranges and Frequencies

The above procedures must also be performed for 45 Hz, 2 KHz and 5 KHz. The load impedance, output voltage levels, output current levels and tolerances should be taken from Table 4-2.

TABLE 4-2

VOLTAGE RANGE	LOAD IMPEDANCE	OUTPUT VOLTAGE	OUTPUT CURRENT	OUTPUT CURRENT TOLERANCE
10-135 VAC	110.25	105 VAC	0.9523	$\pm 0.02$

#### 5.0 MULTIPHASE OPERATION

The 101T-3336 is designed for multiphase operation, however, special interconnect hardware must be utilized. See system Manual Addendum SER 3614 suffix for multiphase operation.

#### 6.0 DOCUMENTATION

Refer to the standard Model 101T Instruction Manual and to modification drawing 4010-463 and 4995-732, parts lists 4010-463-1 and 4995-732-1 and schematic 4995-616 and 4010-096.

## 7.0 PROGRAMMING

Refer to Model 849TA Programmable Control Module Instruction Manual, section 3.2.5.8.

BY THE POWER INPUT AND  
POWER OUTPUT LEADS AS SEVERE  
DAMAGE WILL OCCUR TO THE UNIT  
AND THE WARRANTY WILL BE INVALID!

- 1 FOR LOCATION OF 'H.O.' GND ON POWER SOURCE WITH NUMBERED TERMINAL BLOCKS. REFER TO SCHEMATIC DIAGRAM IN THE POWER SOURCE INSTRUCTION MANUAL.
- 2 SOME MODELS ARE SUPPLIED WITH POWER CORDS; HIGH POWER INPUT IS THE BLACK WIRE, GND IS THE GREEN WIRE, SOME MODELS ARE SUPPLIED WITH INTERNAL BLOCKS FOR POWER INPUT WIRING. REFER TO SECTION 2.1 OF THE POWER SOURCE INSTRUCTION MANUAL.
- 3 FOR POWER INPUT WIRE, REFER TO SECTION 2.2 OF THE POWER SOURCE INSTRUCTION MANUAL.
- 4 FOR POWER INPUT OPERATING VOLTAGE LEVELS, REFER TO SECTION 2.3 OF THE INDIVIDUAL POWER SOURCE INSTRUCTION MANUAL.
- 5 NOTES UNLESS OTHERWISE INDICATED

**(GALILEO)**

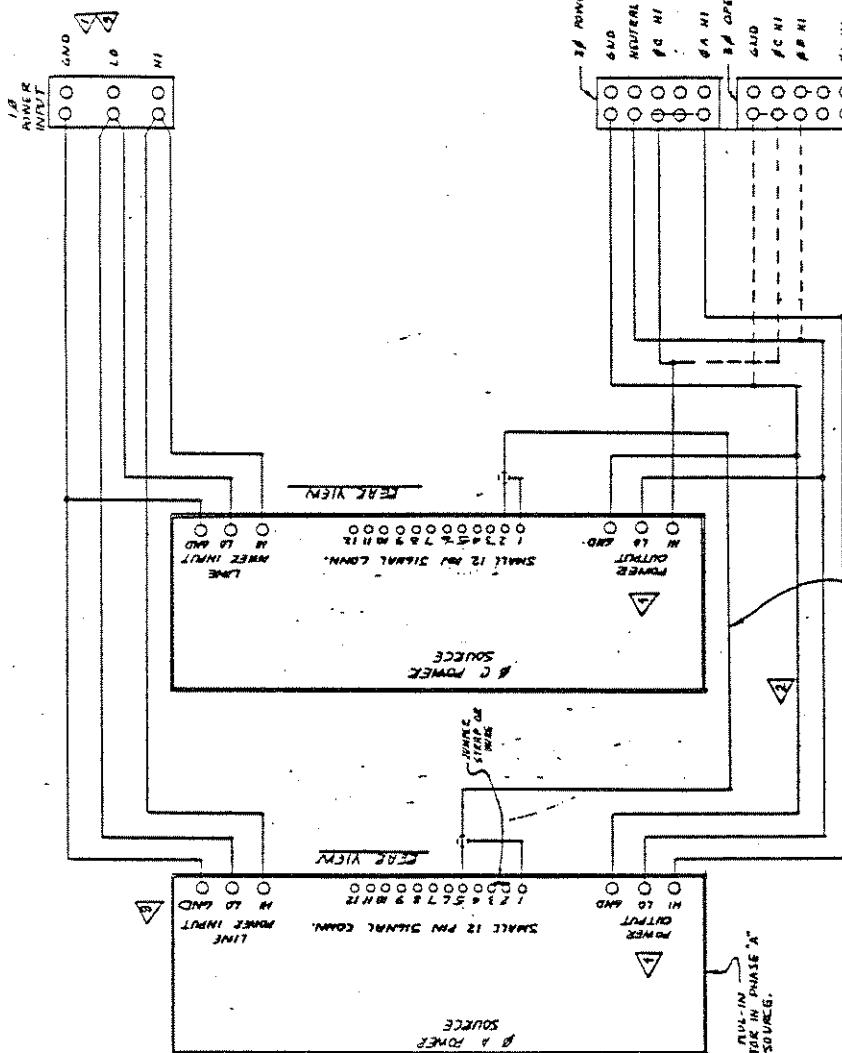

MANUAL ADDENDUM

Model 200T/2-3D

1.0 GENERAL:

The Model 200T/2-3D AC Power System consists of two Model 101T AC Power Sources connected as shown in Drawing D4995-806, and provides 200 VA. Under normal operating conditions, both Model 101T's are adjusted to provide the same output voltage with their front panel GAIN controls. The two outputs of the Model 101T's provide the phase A and phase C of the delta, the third leg of the delta is then generated between the two high outputs of the Model 101T's. This third leg is equal in the amplitude to the high to neutral outputs of the Model 101T's. The Model 101T that supplies the phase A output houses the plug-in oscillator.

NOTE: **LAMPS SHOULD BE TAKEN OUT TO REVERSE THE ANSWER INPUT AND POWER OUTPUT LEADS AS SUCH DAMAGE WILL OCCUR TO THE UNIT AND THE WARRANTY WILL BE INVALID!**

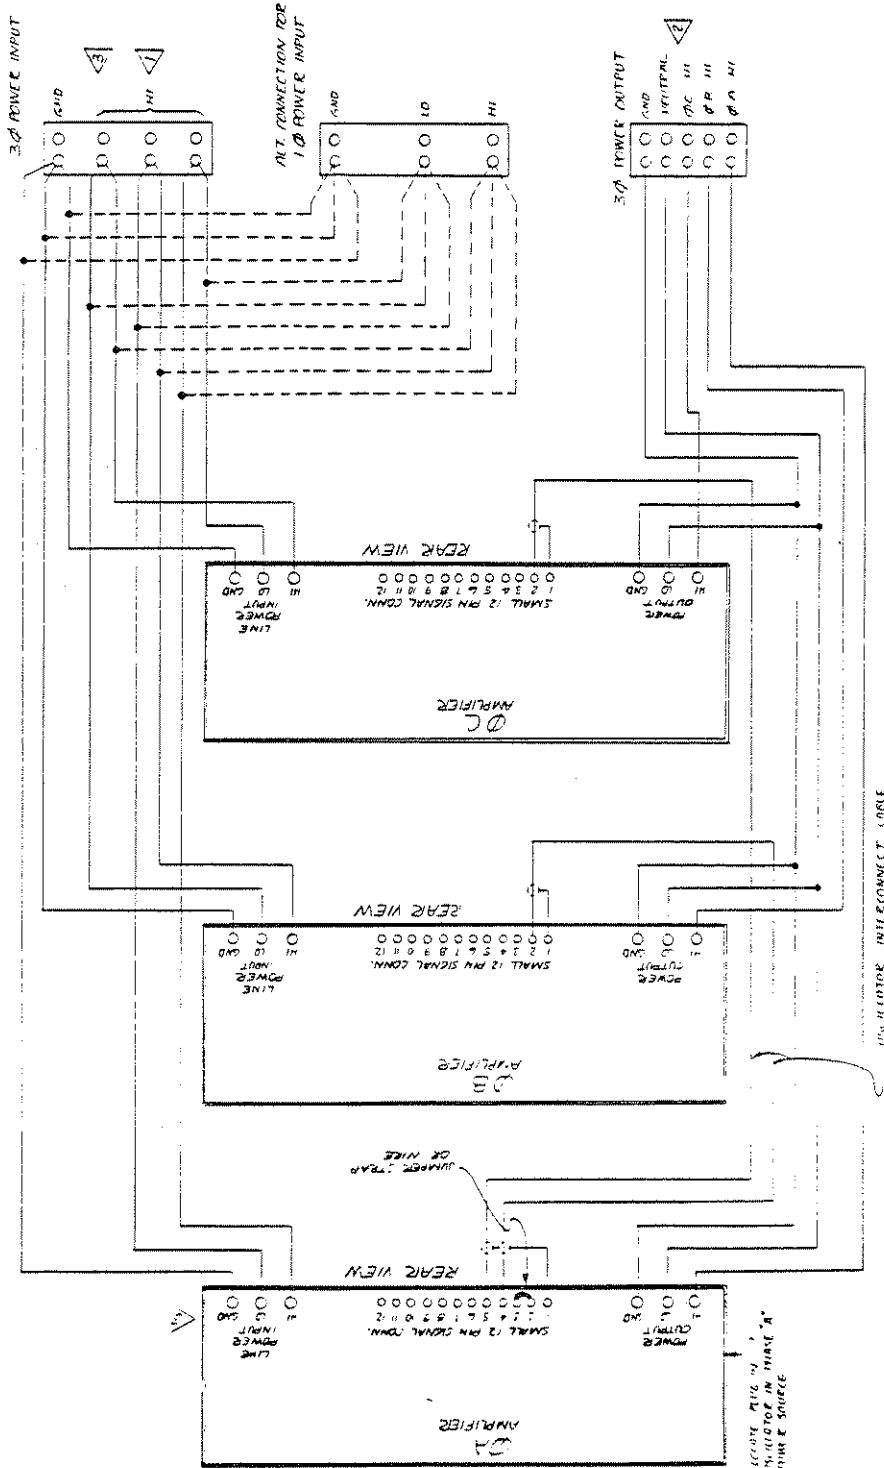

FOR LOCATION OF 110, 120, 240 VAC ON POWER SOURCE WITH NUMBERED TERMINAL BLOCKS, REFER TO SCHEMATIC DIAGRAM IN THE POWER SOURCE INSTRUCTION MANUAL.

SOME MODELS ARE SUPPLIED WITH POWER CORDS; HIGH POWER INPUT IS THE BLACK WIRE. OTHER MODELS ARE SUPPLIED WITH POWER INPUT IN THE WHITE WIRE. A ROUND PIN IS THE GREEN WIRE. SOME MODELS ARE SUPPLIED WITH TERMINAL BLOCKS FOR POWER INPUT (WIRING) REFER TO SECTION E.I.1 OF THE POWER SOURCE INSTRUCTION FOR POWER INPUT WIRE COLOR CODE.

**E.2 OF THE POWER SOURCE INSTRUCTION MANUAL.**  
**F.2 OF THE POWER INPUT OPERATING VOLTAGE LEVELS; REFER TO SECTION**  
**G.2 OF THE INDIVIDUAL POWER SOURCE INSTRUCTION MANUAL.**

*ONE ZONE SHOULD BE TAKEN OUT TO REVIEW THE FIVE AND ONLY ONE AREA IN WHICH A STATE OFFICE WILL BE VALID!*

SECTION  
DESCRIPTION

**3** *RIGHTS OF THE STATE AND INDIVIDUALS IN THE FIELD OF CULTURE.* - The State has the right to regulate the cultural life of the country. It can do so by making laws, by creating institutions, by giving financial support to cultural activities, by encouraging research and by protecting the rights of authors and performers. The State also has the duty to promote education, science, art and culture among all sections of the population. The State has the right to regulate the cultural life of the country. MANUAL ADDENDUM

Model 101T-3016

1.0 GENERAL:

The Model 101T-3016 AC Power Source is similar to the standard Model 101T AC Power Source except that the 101T-3016 has a frequency response from 15 Hz to 999 Hz. The unit will deliver from 0 to 120 volts rms output while working into a 2880 ohm load (5VA).

2.0 SPECIFICATIONS:

The specifications for the Model 101T-3016 AC Power Source are listed below and apply when the power source is used with a Model 845T-1-3016 Oscillator or a Model 847T-1-3016 Oscillator.

POWER OUTPUT: 5 VA at 120 volts rms from unity to  $\pm 0.7$  power factor.

OUTPUT VOLTAGE RANGE: 0 to 120 volts rms.

NUMBER OF PHASES: Single phase output.

OUTPUT FREQUENCY: 15 Hz to 999 Hz.

TOTAL HARMONIC DISTORTION: 1.0% percent maximum from 15 Hz to 999 Hz.

AMPLITUDE STABILITY:  
(after one hour warm-up)  $\pm 0.25\%$  for 24 hours at constant line, load and ambient temperature conditions.

LOAD RANGE:  $\pm 1\%$  over the range from 15 Hz to 999 Hz when tested at unity power factor. In addition, a load regulation to be adjusted to zero at any given line voltage, signal frequency and load conditions. Control resolution is 0.1%.

LINE REGULATION:  $\pm 0.10\%$  of full output for a  $\pm 10\%$  line change.

FULL POWER FREQUENCY RANGE: 15 Hz to 999 Hz (power source only).

FREQUENCY RESPONSE:	$\pm 0.5$ dB from 15 Hz to 999 Hz.
AC NOISE LEVEL:	80 dB below full output when tested with a shorted input; 70 dB below full input power tested at full power output.
OVERLOAD AND SHORT CIRCUIT PROTECTION:	Complete protection from overloads and short circuit is provided. Automatic reset occurs when overload is removed.
AMPLIFIER DRIVE REQUIREMENTS: (Normally obtained from plug-in)	5 volts rms (maximum) produces 120 volts rms.
AC INPUT LINE:	105 to 125 volts rms, single phase.
AC INPUT FREQUENCY:	48 to 65 Hz.
AC INPUT POWER:	200 watts maximum under worst case line and full rated load conditions.
OPERATING TEMPERATURE RANGE:	0 to 55°C.
FRONT PANEL METER:	0 to 160 volt AC voltmeter provides $\pm 3\%$ of full scale accuracy over the range from 15 Hz to 999 Hz.
DIMENSIONS:	3 - 1/2" high X 19" wide X 17.5" deep.
NET WEIGHT:	35 pounds.
SHIPPING WEIGHT:	40 pounds.
FRONT PANEL FINISH:	Gray, 26440 per Federal Standard 595 with black silk-screened lettering.

### 3.0 THEORY OF OPERATION:

The theory of operation section given in Section 3.0 of the standard 101T Instruction Manual is correct except as noted below:

- a) The output transformer T2 has been replaced with an output transformer whose bandwidth extends from 15 Hz to 1.0 KHz and whose secondary voltage is 120 volts rms rather than 135 volts rms.

- b) The values of capacitors A1C2, A1C3, A1C5, A1C6 and A1C13 have been increased in value to provide improved low-frequency response. The values of capacitors A1C4, A1C7, A1C10, and A1C11 have been increased in value to provide a greater stability margin at high frequencies. Transistors A1Q11 and A2Q3 and associated components have been removed to provide proper operation of the overload circuit at reduced power output.

A complete schematic for the Model 101T-3016 AC Power Source is given in Drawing 4010-084.

4.0 CALIBRATION:

The calibration procedure given in the standard 101T manual is not applicable. The following procedure should be used:

- 1) Apply power to the unit with the Model 845T-1-3016 Plug-in installed in the 101T-3016 Power Source. Set the oscillator frequency to 45 Hz.
- 2) Turn the front panel GAIN control fully counterclockwise and check that the input power is less than 60 watts. If this is not the case, perform Step 4.3.2 in the standard 101T Instruction Manual.
- 3) Set the output of the unit to 120 volts rms with a differential voltmeter connected to the output of the 101T Power Source and check that the front panel METER is within  $\pm 3.0$  percent of the actual output voltage. Adjust A1R39, if required. Check that the front panel voltmeter reads within  $\pm 3$  percent of the actual output voltage when tested from 15 Hz to 999 Hz.
- 4) Set the internal load regulation control A1R3 so that the output voltage variation is less than 120 millivolts rms as the SVA load is applied to the output of the 101T-3016 Power Source.  
Vary the output frequency from 15 Hz to 999 Hz and check that the load regulation remains within  $\pm 1.2$  volts rms.
- 5) Check that the output distortion does not exceed 1.0 percent at 45 Hz with a 5 VA resistive load (2880 ohms).  
Repeat this test at 15 Hz and at 999 Hz. The distortion must remain below 1.0% at 15 Hz and 999 Hz.

- 6) Vary the line voltage from 103.5 to 126.5 volts rms and check that the output voltage varies less than 240 millivolts rms for operation at either 15 Hz to 999 Hz.

#### 5.0 PARTS LIST:

A parts list which indicates how to build a Model 101T-3016 AC Power Source from a standard Model 101T is given in Drawing 4010-435.

## ONE YEAR WARRANTY

CALIFORNIA INSTRUMENTS CORPORATION warrants each instrument manufactured by them to be free from defects in material and workmanship for a period of one year from the date of shipment to the original purchaser. Excepted from this warranty are tubes, fuses, and batteries which carry the warranty of their original manufacturer where applicable. CALIFORNIA INSTRUMENTS will service, replace, or adjust any defective part or parts, free of charge, when the instrument is returned freight prepaid, and when examination reveals that the fault has not occurred because of misuse, abnormal conditions of operation, user modification, or attempted user repair. Equipment repaired beyond the effective date of warranty or when abnormal usage has occurred will be charged at applicable rates. CALIFORNIA INSTRUMENTS will submit an estimate for such charges before commencing repair, if so requested.

## PROCEDURE FOR SERVICE

If a fault develops, notify CALIFORNIA INSTRUMENTS or its local representative, giving full details of the difficulty, including the model number and serial number. On receipt of this information, service information or a Return Material Authorization (RMA) number will be given. Add RMA No. to shipping label. Pack instrument carefully to prevent transportation damage, affix label to shipping container, and ship freight prepaid to the factory. CALIFORNIA INSTRUMENTS shall not be responsible for repair of damage due to improper handling or packing. Instruments returned without RMA No., or freight collect will be refused. Instruments repaired under Warranty will be returned by prepaid surface freight. Instruments repaired outside the Warranty period will be returned freight collect, F.O.B. CALIFORNIA INSTRUMENTS, San Diego, CA. If requested, an estimate of repair charges will be made before work begins on repairs not covered by the Warranty.

## DAMAGE IN TRANSIT

The instrument should be tested as soon as it is received. If it fails to operate properly, or is damaged in any way, a claim should be filed immediately with the carrier. A full report of the damage should be obtained by the claim agent, and a copy of this report should be forwarded to us. CALIFORNIA INSTRUMENTS will prepare an estimate of repair cost and repair the instrument when authorized by the claim agent. Please include model number and serial number when referring to the instrument.
