MS2665C/67C/68C Spectrum Analyzer Operation Manual Vol. 3 (Programming)

Sixth Edition

Read this manual before using the equipment.

Keep this manual with the equipment.

ANRITSU CORPORATION

OCT. 2003

Document No.: M-W1335AE-6.0

Safety Symbols

To prevent the risk of personal injury or loss related to equipment malfunction, Anritsu Corporation uses the following safety symbols to indicate safety-related information. Insure that you clearly understand the meanings of the symbols BEFORE using the equipment.

Symbols used in manual

DANGER 🛆

This indicates a very dangerous procedure that could result in serious injury or death if not performed properly.

WARNING **A**

This indicates a hazardous procedure that could result in serious injury or death if not performed properly.

CAUTION \triangle

This indicates a hazardous procedure or danger that could result in light-to-severe injury, or loss related to equipment malfunction, if proper precautions are not taken.

Safety Symbols Used on Equipment and in Manual

(Some or all of the following five symbols may not be used on all Anritsu equipment. In addition, there may be other labels attached to products which are not shown in the diagrams in this manual.)

The following safety symbols are used inside or on the equipment near operation locations to provide information about safety items and operation precautions. Insure that you clearly understand the meanings of the symbols and take the necessary precautions BEFORE using the equipment.

This indicates a prohibited operation. The prohibited operation is indicated symbolically in or near the barred circle.

This indicates an obligatory safety precaution. The obligatory operation is indicated symbolically in or near the circle.

This indicates warning or caution. The contents are indicated symbolically in or near the triangle.

This indicates a note. The contents are described in the box.

These indicate that the marked part should be recycled.

For Safety

CAUTION 🗘

Changing Fuse

 ${\bf CAUTION}\, {\bf \triangle}$

Before changing the fuses, ALWAYS remove the power cord from the power outlet and replace the blown fuses. ALWAYS use new fuses of the type and rating specified on the fuse marking on the rear panel of the cabinet.

T5A indicates a time-lag fuse.

There is risk of receiving a fatal electric shock if the fuses are replaced with the power cord connected.

- 2. Keep the power supply and cooling fan free of dust.
 - Clean the power inlet regularly. If dust accumulates around the power pins, there is a risk of fire.
 - Keep the cooling fan clean so that the ventilation holes are not obstructed. If the ventilation is obstructed, the cabinet may overheat and catch fire.

Input Level

Cleaning

- 3. Maximum DC voltage ratings:
 - RF Input DC 0 V
 - Maximum AC power ratings:
 - RF Input +30 dBm
 - NEVER input a >+30 dBm and >DC 0 V power to RF Input.
 - Excessive power may damage the internal circuits.

For Safety

CAUTION A

Replacing Memory Backup Battery

The power for memory backup is supplied by a Polycarbonmonofluoride Lithium Battery. This battery should only be replaced by a battery of the same type; since replacement can only be made by Anritsu, contact the nearest Anritsu representative when replacement is required.

Note: The Battery life is about 7 years. Early battery replacement is recommended.

Storage Medium

5. This equipment stores data and programs using Plug-in Memory card (MC).

Data and programs may be lost due to improper use or failure.

ANRITSU therefore recommends that you backup the memory.

ANRITSU CANNOT COMPENSATE FOR ANY MEMORY LOSS.

Please pay careful attention to the following points.

- Do not remove the IC card from equipment being accessed.
- Isolate the card from static electricity.
- The backup battery in the SRAM memory card has a limited life; replace the battery periodically.

Disposing of The Product

 This equipment uses chemical compound semiconductor including arsenide.

At the end of its life, the equipment should be recycled or disposed properly according to the local disposal regulations.

Equipment Certificate

Anritsu Corporation certifies that this equipment was tested before shipment using calibrated measuring instruments with direct traceability to public testing organizations recognized by national research laboratories including the Electrotechnical Laboratory, the National Research Laboratory of Metrology and the Communications Research laboratory, and was found to meet the published specifications.

Anritsu Warranty

Anritsu Corporation will repair this equipment free-of-charge if a malfunction occurs within 1 year after shipment due to a manufacturing fault, provided that this warranty is rendered void under any or all of the following conditions.

- The fault is outside the scope of the warranty conditions described in the operation manual.
- The fault is due to misoperation, misuse, or unauthorized modification or repair of the equipment by the customer.
- The fault is due to severe usage clearly exceeding normal usage.
- The fault is due to improper or insufficient maintenance by the customer.
- The fault is due to natural disaster including fire, flooding and earthquake, etc.
- The fault is due to use of non-specified peripheral equipment, peripheral parts, consumables, etc.
- The fault is due to use of a non-specified power supply or in a non-specified installation location.

In addition, this warranty is valid only for the original equipment purchaser. It is not transferable if the equipment is resold.

Anritsu Corporation will not accept liability for equipment faults due to unforeseen and unusual circumstances, nor for faults due to mishandling by the customer.

Anritsu Corporation Contact

If this equipment develops a fault, contact the head office of Anritsu Corporation at the address in the operation manual, or your nearest sales or service office listed on the following pages.

Front Panel Power Switch

To prevent malfunction caused by accidental touching, the front power switch of this equipment turns on the power if it is pressed continuously for about one second in the standby state. If the switch is pressed continuously for one second in the power-on state, the equipment enters the standby state.

In the power-on state, if the power plug is removed from the outlet, then reinserted into it, the power will not be turned on. Also, if the lines is disconnected due to momentary power supply interruption or power failure, the power will not be turned on (enters the standby state) even if the line is recovered.

This is because this equipment enters the standby state and prevents incorrect data from being acquired when the line has to be disconnected and reconnected.

For example, if the sweep time is 1,000 seconds and data acquisition requires a long time, momentary power supply interruption (power failure) might occur during measurement and the line could be recovered automatically to power-on. In such a case, the equipment may mistake incorrect data for correct data without recognizing the momentary power supply interruption.

If this equipment enters the standby state due to momentary power supply interruption or power failure, check the state of the measuring system and press the front power switch to restore power to this equipment.

Further, if this equipment is built into a system and the system power has to be disconnected then reconnected, the power for this equipment must also be restored by pressing the front power switch.

Consequently, if this equipment is built into remote monitoring systems that use MODEMs, the standby function of this equipment must be modified.

ABOUT DETECTION MODE

This instrument is a spectrum analyzer which uses a digital storage system. The spectrum analyzer makes level measurements in frequency steps obtained by dividing the frequency span by the number of measurement data points (501). This method of measurement cannot detect the signal peak level if the spectrum of a received signal is narrower than these frequency steps.

To resolve this problem, this instrument usually operates in positive peak detection mode and normal detection mode. In the positive peak detection mode, the highest level within the frequency range between the sample points can be held and traced. In the normal detection mode, both the positive peak and the negative peak can be traced.

Positive peak detection mode should be used for almost all measurements including normal signal level measurement, pulsed noise analysis, and others. It is impossible to measure the signal level accurately in sample detection mode or in negative peak detection mode.

Use of sample detection mode is restricted to random noise measurement, occupied frequency bandwidth measurement for analog communication systems, and adjacent-channel leakage power measurement, etc.

	Measurement		item
•	Normal signal		POS PEAK
•	Random noise		SAMPLE
٠	Pulsed noise		NORMAL (POSI-NEG)
•	Occupied freque	ncy bandwidth, adjacent-channel leakage power	SAMPLE
		(for analog communication systems)	•
•	Occupied freque	ncy bandwidth, adjacent-channel leakage power	POS PEAK or SAMPLE
		(for digital communication systems)	

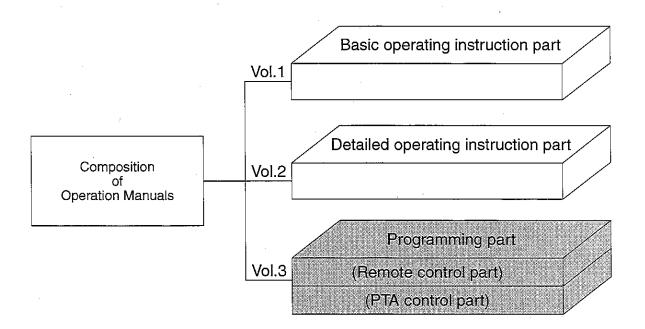

When a detection mode is specified as one of the measurement methods, make the measurement in the specified detection mode.

ABOUT THIS MANUAL

(1) Composition of MS2665C/67C/68C spectrum analyzer Operation Manuals

The MS2665C/67C/68C Spectrum Analyzer operation manuals of the standard type are composed of the following three documents. Use them properly according to the usage purpose.

Basic operating instruction part:

Basic Operating Instructions: Provides information on the MS2665C/67C/68C outline, preparation before use, panel description, basic operation, soft-key menu and performance tests.

Detailed operating instruction part:

Detailed Operating Instructions: Provides information on the detailed panel operating instructions on the spectrum analyzer that expand on the basic operation and soft-key menu in the Basic Operating Instruction Part.

Programming part:

Composed of the Remote Control Part and PTA Control Part. The Remote Control Part provides information on RS-232C remote control GPIB remote control and sample programs, while the PTA Control Part describes about PTA operation and PTL commands.

SECTION 1 GENERAL

General

The MS2665C/67C/68C Spectrum Analyzer, when combined with an external controller (host computer, personal computer, etc.), can automate your measurement system. For this purpose, the spectrum analyzer is equipped with an RS-232C interface port, GP-IB interface bus (IEEE std 488.2-1987).

Remote control functions

The remote control functions of the MS2665C/67C/68C are used to do the following:

- (1) Control all functions except a few like the power switch and [LOCAL] key
- (2) Read all parameter settings.
- (3) Set the RS-232C interface settings from the panel
- (4) Set the GP-IB address from the panel
- (5) Select the interface port application from the panel
- (6) Configure the automatic measurement system when the spectrum analyzer is combined with a personal computer and other measuring instruments.

Interface port selection functions

The MS2665C/67C/68C Spectrum Analyzer has a standard RS-232C interface, and an optional GP-IB interface bus and parallel (Centro) interface (option 10). Use the panel to select the interface port to be used to connect external devices as shown below.

Port for the external controller: Select RS-232C or GP-IB.

Port for the printer or plotter: Select RS-232C or GP-IB or Centro.

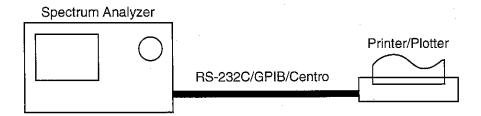

Port for the external device controlled from the PTA: Select RS-232C or GP-IB or Centro.

Each interface can connect only one device.

Examples of system upgrades using RS-232C and GP-IB

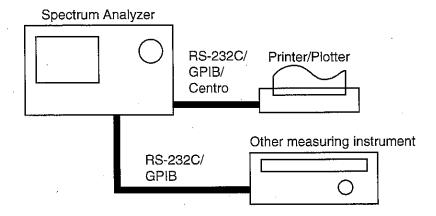

(1) Stand-alone type 1

Waveforms measured with the MS2665C/67C/68C are output to the printer and plotter.

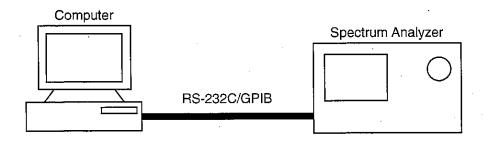

(2) Stand-alone type 2

Other measuring instruments are controlled from the PTA. The printer, plotter, and external device controlled from the PTA must be connected using different interfaces.

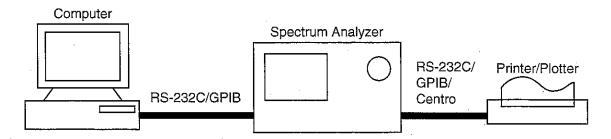

(3) Control by the host computer (1)

The spectrum analyzer is controlled automatically or remotely from the computer.

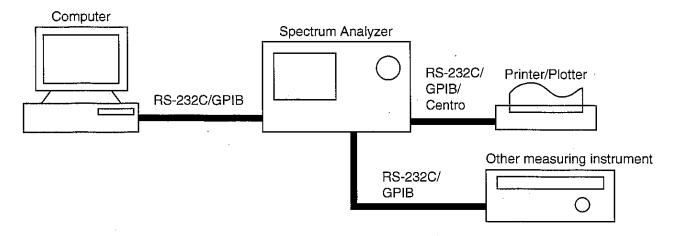

(4) Control by the host computer (2)

The waveforms measured by controlling spectrum analyzer automatically or remotely are output to the printer and plotter. The external controller, printer, and plotter must be connected using different interfaces.

(5) Control by the host computer (3)

The waveforms measured by controlling the spectrum analyzer automatically or remotely are output to the printer and plotter. PTA programs are executed from the computer. The printer, plotter, and external device controlled from the PTA must be connected using different interfaces.

Specifications of RS-232C

The table below lists the specifications of the RS-232C provided as standard in the MS2665C/67C/68C.

Item	Specification
Function	Outputs printing data to the printer and plotter. Control from the external controller (except for power-ON/OFF)
Communication system	Asynchronous (start-stop synchronous system), half-duplex
Communication control system	X-ON/OFF control
Baud rate	
Data bits	7 or 8 bits
Parity	Odd number (ODD), even number (EVEN), none (NON)
Start bit	1 bit
Stop bit (bits)	1 or 2 bits
Connector	D-sub 9-pin, female

Specifications of GP-IB

The table below lists the specifications of the GP-IB provided for the MS2665C/67C/68C.

Item	Specification and supplementary explanation
Function	Conforms to IEEE488.2 The spectrum analyzer is controlled from the external controller (except for power-on/off). The spectrum analyzer is used as a controller for an external device (printer or plotter).
Interface function (*1)	SH1: All source handshake functions are provided. Synchronizes the timing of data transmission.
	AH1: All acceptor handshake functions are provided. Synchronizes the timing of data reception.
	T6: The basic talker functions and serial poll function are provided. The talk only function is not provided. The talker can be canceled by MLA.
	L4: The basic listener functions are provided. The listenonly function is not provided. The listener can be canceled by MTA.
	SR1: All service request and status byte functions are provided.
į	RL1: All remote/local functions are provided.
	The local lockout function is provided.
	PPO: The parallel poll functions are not provided.
	DC1: All device clear functions are provided.
	DT1: Device trigger functions are provided.
	C1: System controller functions are provided.
·	C2: IEC is transmitted.
	C3: The REN transmission function is provided.
	C4: Responses to SRQ are returned.
	C28: Interface messages are transmitted.
	E2: Output is tri-state.

^{*1} For details of the interface functions, see the GP-IB Basic Guide sold separately.

SECTION 2 CONNECTING DEVICE

This section describes how to connect external devices such as the host computer, personal computer, printer, and plotter with RS-232C and GP-IB cables. This section also describes how to setup the interfaces of the spectrum analyzer.

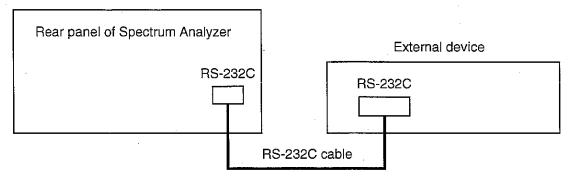

TABLE OF CONTENTS

Connecting an external device with an RS-232C cable	
Connection diagram of RS-232C interface signals	2-4
Setting the connection port interfaces	2-5
Setting the RS-232C interface conditions	2-6
Connecting a device with a GP-IB cable	
Setting the GP-IB address	2-8

SECTION 2 CONNECTING DEVICE

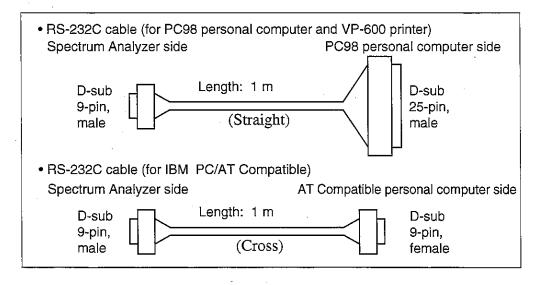

Connecting an external device with an RS-232C cable

Connect the RS-232C connector (D-sub 9-pin, female) on the rear panel of the spectrum analyzer to the RS-232C connector of the external device with an RS-232C cable.

Notes:

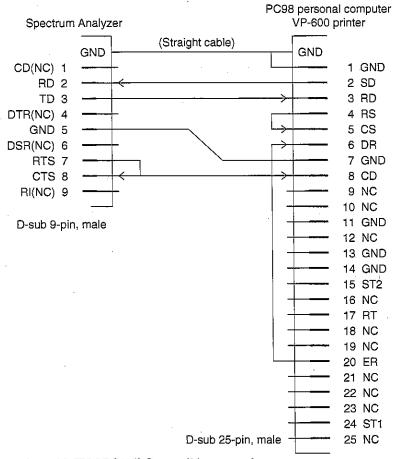

RS-232C connectors with 9 pins and 25 pins are available. When purchasing the RS-232C cable, check the number of pins on the RS-232C connector of the external device. Also, the following RS232C cables are provided as peripheral parts of the spectrum analyzer.

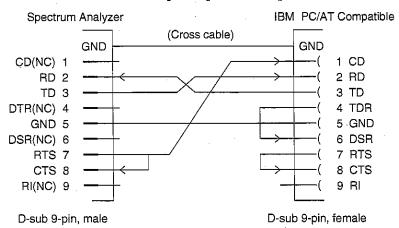

Connection diagram of RS-232C interface signals

The diagram below shows the RS-232C interface signal connections between the spectrum analyzer and devices such as a personal computer or printer.

• Connection with PC98 personal computer or VP-600 printer

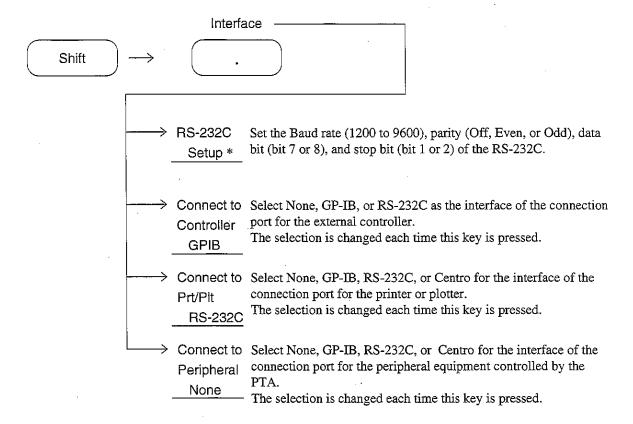

· Connection with IBM PC/AT Compatible personal computer

Setting the connection port interfaces

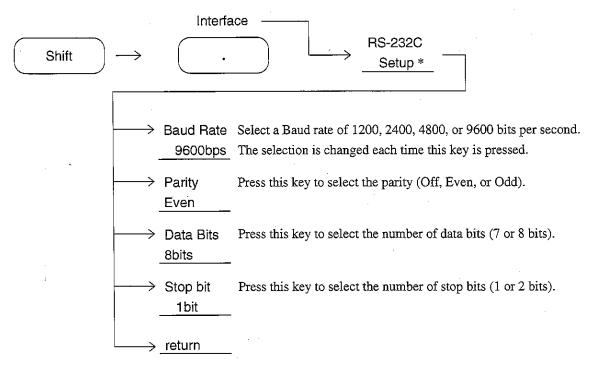

Set the interfaces between connection ports of the spectrum analyzer and external devices such as a personal computer, printer, or plotter.

In the above example, the GP-IB interface is selected for the connection port for the external controller, and the RS-232C interface is selected for the connection port for the printer or plotter.

Setting the RS-232C interface conditions

Set the RS-232C interface conditions of this equipment to those of the external device to be connected.

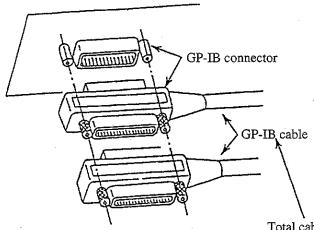

For how to set the RS-232C interface of an external device, see the operation manual of the external device.

Connecting a device with a GP-IB cable

Connect the GP-IB connector on the rear panel of this equipment to the GP-IB connector of an external device with a GP-IB cable.

Note: Be sure to connect the GP-IB cable before turning the equipment power on.

Up to 15 devices, including the controller, can be connected to one system. Connect devices as shown below.

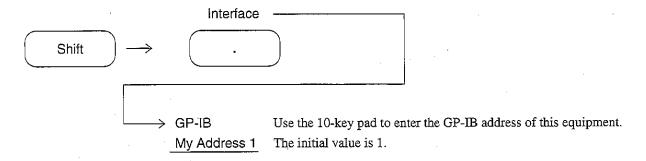

Total cable length: Up to 20 m

Cable length between devices: Up to 4 m

Number of devices that can be connected: Up to 15

Setting the GP-IB address

Set the GPIB address of this equipment as follows.

For how to set the GPIB address of an external device, see the operation manual of the external device.

SECTION 3

DEVICE MESSAGE FORMAT

This section describes the format of the device messages transmitted on the bus between a controller (host computer) and device (MS2665C/67C/68C) via the RS-232C or GP-IB system.

TABLE OF CONTENTS

General Description	3-3
Program message format	3-3
Response message format	3-8

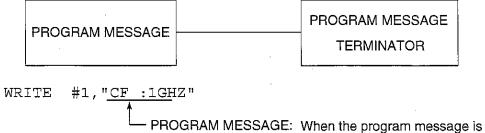

SECTION 3 DEVICE MESSAGE FORMAT

General description

The device messages are data messages transmitted between the controller and devices, program messages transferred from the controller to this instrument (device), and response messages input from this instrument (device) to the controller. There are also two types of program commands and program queries in the program message. The program command is used to set this instrument's parameters and to instruct it to execute processing. The program query is used to query the values of parameters and measured results.

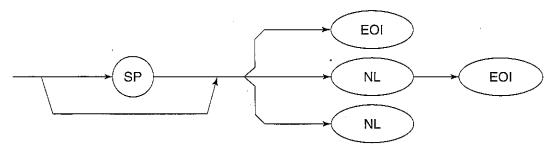

Program message format

To transfer a program message from the controller program to this instrument using the WRITE statement, the program message formats are defined as follows.

When the program message is transmitted from the controller to this instrument, the specified terminator is attached to the end of the program message to terminate its transmission.

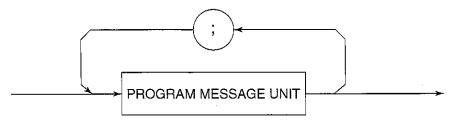

(1) PROGRAM MESSAGE TERMINATOR

NL: Called New line or LF (Line Feed)

Carriage Return (CR) is ignored and is not processed as a terminator.

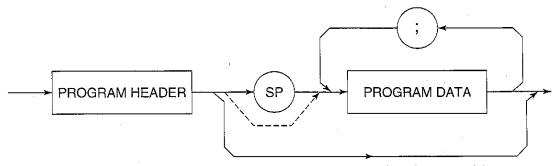

(2) PROGRAM MESSAGE

Multiple program message units can be output sequentially by separating them with a semicolon.

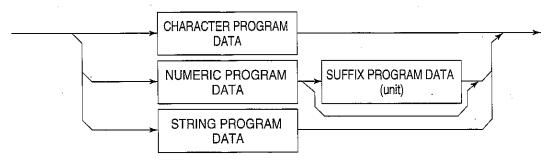

<Example> WRITE #1; "CF 1GHZ; SP 500KHZ

(3) PROGRAM MESSAGE UNIT

- The program header of an IEEE488.2 common command always begins with an asterisk.
- For numeric program data, the SP between the header and data can be omitted.
- The program header of a program query always ends with a question mark.

(4) PROGRAM DATA

(5) CHARACTER PROGRAM DATA

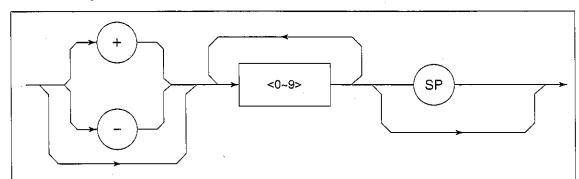

Character program data is specific character string data consisting of the uppercase alphabetic characters from A to Z, lowercase alphabetic characters from a to z, numbers 0 to 9, and underline (_).

<Example> WRITE #1; "ST AUTO"..... Sets Sweep Time to AUTO.

(6) NUMERIC PROGRAM DATA

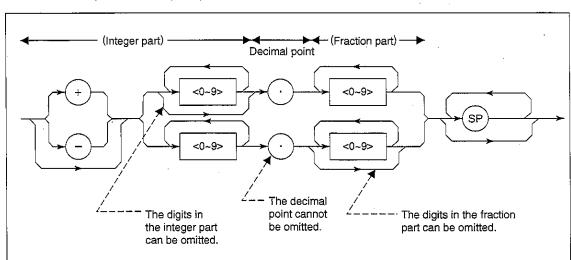

Numeric program data has two types of formats: integer format (NR1) and fixed-point format (NR2).

< Integer format (NR1) >

- Zeros can be inserted at the beginning \rightarrow 005, +000045
- There must be no spaces between a + or sign and a number \rightarrow +5, + \triangle 5 (×)
- Spaces can be inserted after a number \rightarrow +5 $\triangle\triangle$
- The + sign is optional \rightarrow +5, 5
- Commas cannot be used to separate digits \rightarrow 1,234,567 (×)

<Fixed-point format (NR2)>

- The numeric expression of the integer format applies to the integer part.
- There must be no spaces between numbers and the decimal point $\rightarrow +753\triangle.123$ (×)
- Spaces can be inserted after the digits in the fraction part \rightarrow +753.123 $\triangle\triangle\triangle$
- A number need not be placed before the decimal point \rightarrow .05
- A + or sign can be placed before the decimal point \rightarrow +.05, -.05
- A number can end with a decimal point \rightarrow 12.

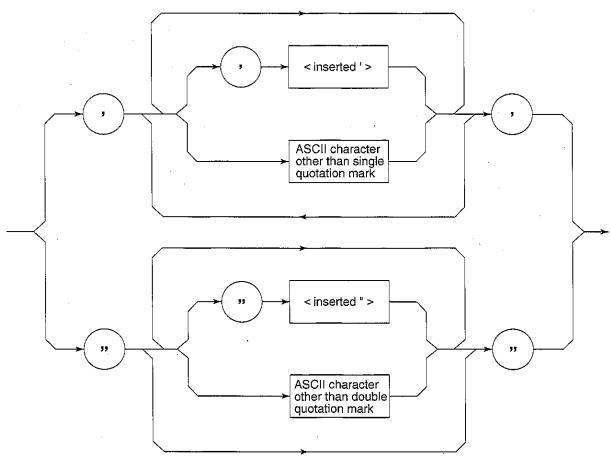

(7) SUFFIX PROGRAM DATA (unit)

The table below lists the suffixes used for the MS2665C/67C/68C.

Table of Suffix Codes

Classification	Unit	Suffix code
,	GHz	GHZ, GZ
	MHz	MHZ, MZ
Frequency	kHz	KHZ, KZ
	Hz	HZ
	Default	HZ
	s	S
Time	ms	MS
Time	μs	US
	Default	MS
	dB	DB
	dBm	DBM, DM
	dΒμV	DBUV
Level (dB system)	dBmV	DBMV
	dBμV(emf)	DBUVE
	Default	Determined in conformance with the set scale unit
	V	
Level () (puetom)	mV	MV
Level (V system)	μV	υv
	Default	ŪV
	W	W
	mW	MW
	μW	ŪW
Level (W system)	nW	ИМ
	pW	PW
	fW	FW
	Default	WU

(8) STRING PROGRAM DATA

• String program data must be enclosed with single quotation marks ('...').

WRITE #1:"TITLE'MS2665C'"

A single quotation mark used within a character string must be repeated as shown in the double quotation marks.

WRITE #1; "TITLE' MS2665C' 'NOISE MEAS'' "

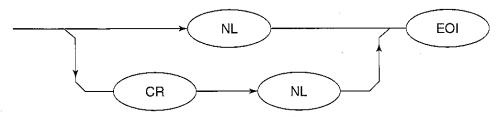

'NOISE MEAS' is set as the title.

Response message format

To transfer the response messages from this instrument to the controller using the READ statement, the response message formats are defined as follows.

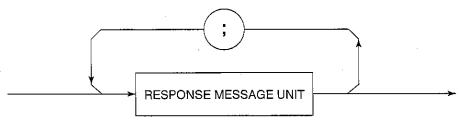

(1) RESPONSE MESSAGE TERMINATOR

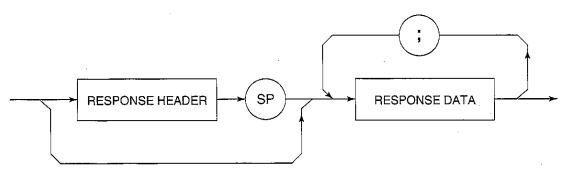

The response message terminator to be used depends on the TRM command specification.

(2) RESPONSE MESSAGE

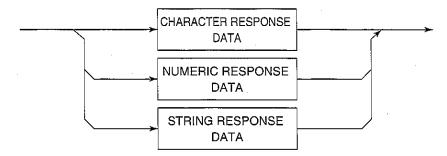

When a query is sent by the WRITE statement with one or more program queries, the response message also consists of one or more response message units.

(3) Usual RESPONSE MESSAGE UNIT

(4) RESPONSE DATA

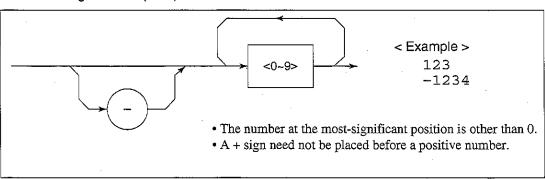

(5) CHARACTER RESPONSE DATA

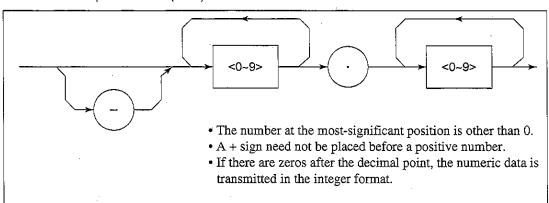

Character response data is specific character string data consisting of the uppercase alphabetic characters from A to Z, lowercase alphabetic characters from a to z, numbers 0 to 9, and underline (_).

(6) NUMERIC RESPONSE DATA

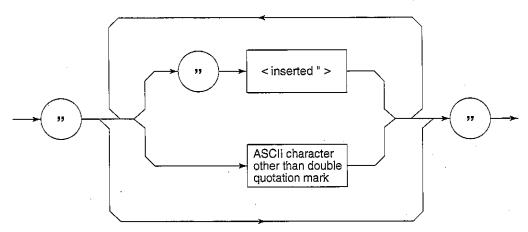

< Integer format (NR1) >

< Fixed-point format (NR2) >

(7) CHARACTER RESPONSE DATA

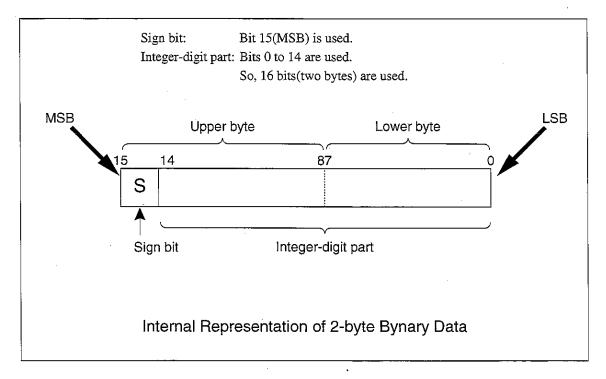

String response data is transmitted as an ASCII character enclosed with double quotation marks.

(8) Response message for input of waveform data using binary data

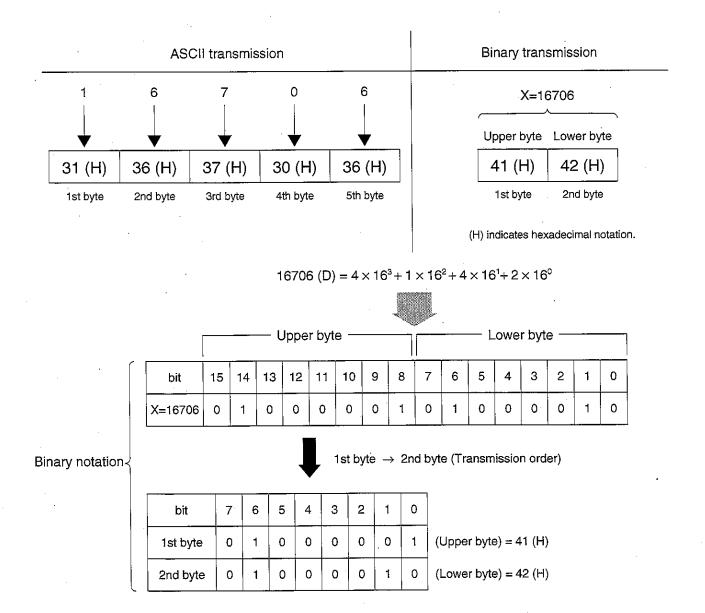

The waveform binary data is two-byte 65536 integer data from -32768 to 32767, as shown below; and sent in the sequence of upper byte and lower byte.

With Sign	No Sign
-32768	32768
-32767	32769
-32766	32770
- 3	65533
-2	65534
-1	65535
0	0
1	1
. 2	2
3	. 3
32765	32765
32766	32766
32767	32767
	-32768 -32767 -32766 -3 -2 -1 0 1 2 3 32765 32766

[†] When a negative number is stored in a numeric variable, the sign bit 1 is set in the MSB to indicate the negative value. The value is stored in a numeric variable in a 2's complement format.

For an example, to transmit an integer of 16706, the ASCII format is compared with the Binary format, below. The ASCII format requires 5 bytes. Whereas, the Binary format requires only 2 bytes, and does not need the data format transformation. So, The Binary format is used for a high-speed transmission.

The waveform binary data has a number of bytes for

(Number of points to be specified) X 2 bytes + termination code.

Where, termination code is specified by the TRM command, and is LF(0D(H): 1 byte) or CR+LF(0A0D(H): 2 bytes).

SECTION 4

STATUS STRUCTURE

This section describes the device-status reporting and its data structure defined by the IEEE488.2 when the GP-IB interface bus is used. This section also describes the synchronization techniques between a controller and device.

These functions are used to control a device from an external controller using the GP-IB interface bus. Most of these functions can also be used to control a device from an external controller using the RS-232C interface

4-2

SECTION 4 STATUS STRUCTURE

The Status Byte (STB) sent to the controller is based on the IEEE488.1 standard. The bits comprising the STB are called status summary messages because they represent a summary of the current data in registers and queues.

IEEE488.2 Standard Status Model

The diagram below shows the standard model for the status data structures stipulated in the IEEE488.2 standard.

In the status model, IEEE488.1 status bytes are used for the lowest grade status. This status byte is composed of seven summary message bits from the higher grade status structure. To create these summary message bits, the status data structure is composed of two types of register and queue models.

Register model	Queue model
The register model consists of two registers used for recording events and conditions encountered by a device. These two registers are the Event Status Register and Event Status Enable Register. When the results of the AND operation of both register contents are other than 0, the corresponding bit of the status bit becomes 1. In other cases, the corresponding bit becomes 0. When the result of their Logical OR is 1, the summary message bit also becomes 1. If the Logical OR result is 0, the summary message bit also becomes 0.	The queue in the queue model is used to sequentially record the waiting status values or information. If the queue is not empty, the queue structure summary message becomes 1. If the queue is empty, the message becomes 0.

In IEEE488.2, there are three standard models for the status data structure. Two are register models and one is a queue model based on the register model and queue model described above. The three standard models are:

- 1) Standard Event Status Register and Standard Event Status Enable Register
- 2) Status Byte Register and Service Request Enable Register Output Queue

has the same structure as the previously described register model. In this register, the bits for eight types of standard events encountered by a device are set as follows: 1) Power on 2) User request 3) Command error 4) Execution error 5) Device-dependent error 6) Query error 7) Request for bus control right 8) Operation complete The Logical OR output bit is represented by Status Byte Register bit 5 (DIO6) as a summary message for	Che Status Byte Register is a egister in which the RQS bit and the seven summary message bits from the status data structure can be set. This register is used together with the Service Request Enable Register. When the results of the OR operation of both egister contents are other than 0, SRQ becomes ON. To indicate this, bit 6 of the Status Byte Register (DIO7) is reserved by the system as the RQS bit. The RQS bit is used to indicate that there is a service request for the external controller. The mechanism of SRQ conforms to the IEEE488.1 standard.	The Output Queue has the structure of the queue model described above. Status Byte Register bit 4 (DIO5) is set as a summary message for Message Available (MAV) to indicate that there is data in the output buffer.

Status Byte (STB) Register

The STB register consists of the STB and RQS (or MSS) messages of the device.

ESB and MAV summary messages

This paragraph describes the ESB and MAV summary messages.

(1) ESB summary message

The ESB (Event Summary Bit) is a message defined by IEEE488.2 which uses bit 5 of the STB register. When the setting permits events to occur, the ESB summary message bit becomes 1 if any one of the events recorded in the Standard Status Register becomes 1. Conversely, the ESB summary message bit becomes 0 if one of the recorded events occurs, even if events are set to occur.

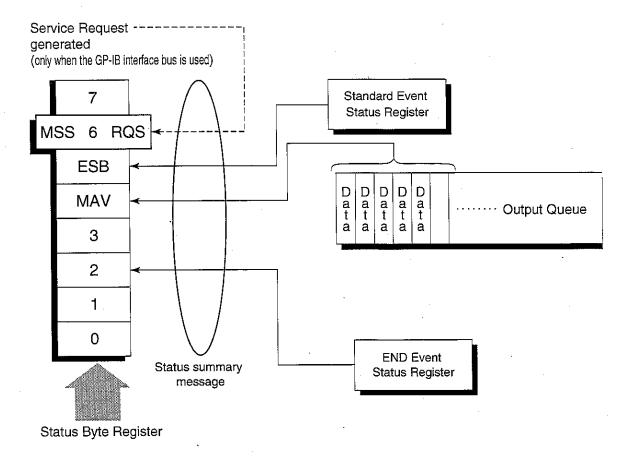

This bit becomes 0 when the ESR register is read by the *ESR? query or when it is cleared by the *CLS command.

(2) MAV summary message

The MAV (Message Available) summary bit is a message defined by IEEE488.2 which uses bit 4 of the STB register. This bit indicates whether the output queue is empty. The MAV summary message bit is set to 1 when a device is ready to receive a request for a response message from the controller. When the output queue is empty, this bit is set to 0. This message is used to synchronize the information exchange with the controller. For example, this message is available when, after the controller sends a query command to a device, the controller waits until MAV becomes 1. While the controller is waiting for a response from the device, other jobs can be processed. Reading the Output Queue without first checking MAV will cause all system bus operations to be delayed until the device responds.

Device-dependent summary messages

As shown in the diagram below, the spectrum analyzer does not use bits 0, 1, 3, and 7, and it uses bit 2 as the summary bit of the Event Status Register.

Reading and clearing the STB register

The STB register can be read using serial polling or the *STB? common query. The IEEE488.1 STB message can be read by either method, but the value sent to bit 6 (position) is different for each method.

The STB register contents can be cleared using the *CLS command.

(1) Reading by serial polling (only when the GP-IB interface bus is used)

The IEEE488.1 serial polling allows the device to return a 7-bit status byte and an RQS message bit which conforms to IEEE488.1. The value of the status byte is not changed by serial polling. The device sets the RQS message to 0 immediately after being polled.

(2) Reading by the *STB? common query

The *STB? common query requires the devices to send the contents of the STB register and the integer format response messages, including the MSS (Master Summary Status) summary message. Therefore, except for bit 6, which represents the MSS summary message, the response to *STB? is identical to that of serial polling.

(3) Definition of MSS (Master Summary Message)

MSS indicates that there is at least one cause for a service request. The MSS message is represented at bit 6 response to an *STB? query, but it is not produced as a response to serial polling. It should not be taken as part of the status byte specified by IEEE488.1. MSS is configured by the overall logical OR in which the STB register and SRQ enable (SRE) register are combined.

(4) Clearing the STB register using the *CLS common command

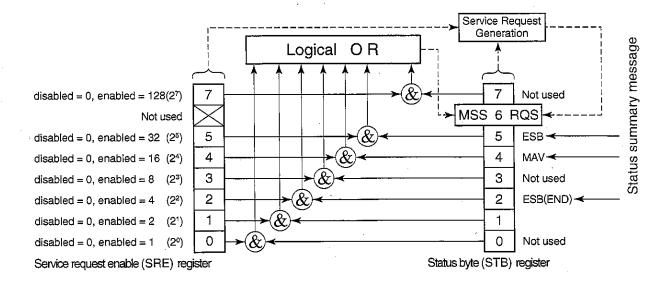

The *CLS common command clears all status data structures as well as the summary messages corresponding to them.

The *CLS command does not affect the settings in the Enable Register.

Service Request (SRQ) Enabling Operation

Bits 0 to 7 of the Service Request Enable Register (SRE) determine which bit of the corresponding STB register can generate SRQ.

The bits in the Service Request Enable Register correspond to the bits in the Status Byte Register. If a bit in the Status Byte Register corresponding to an enabled bit in the Service Request Enable Register is set to 1, the device makes a service request to the controller with the RQS bit set to 1.

(1) Reading the SRE register

The contents of the SRE register are read using the *SRE? common query. The response message to this query is an integer from 0 to 255 which is the sum of the bit digit weighted values in the SRE register.

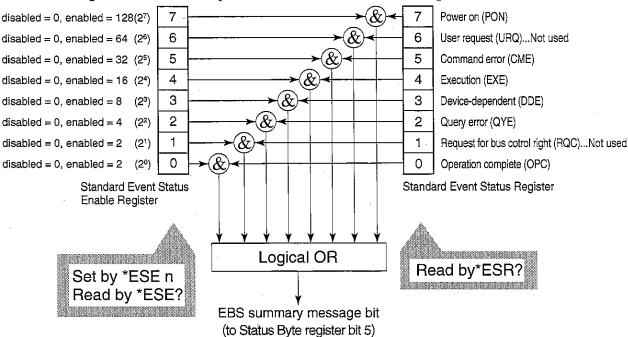

(2) Updating the SRE register

The SRE register is written using the *SRE common command. An integer from 0 to 255 is assigned as a parameter to set the SRE register bit to 0 or 1. The value of bit 6 is ignored.

Standard Event Status Register

Bit definition of Standard Event Status Register

The diagram below shows the operation of the Standard Event Status Register.

The Standard Event Status Enable (ESE) Register on the left is used to select which bits in the corresponding Event Register will cause a TRUE summary message when set.

Bit	Event name	Description
7	Power on (PON-Power on)	A transition from power-off to power-on occurred during the power-up procedure.
6	Not used	
5	Command error (CME-Command Error)	An illegal program message or a misspelled command was received.
4	Execution error (EXE-Execution Error)	A legal but unexecutable program message was received.
3	Device-dependent error (DDE-Device-dependent Error)	An error not caused by CME, EXE, or QYE occurred (parameter error, etc.).
2	Query error (QYE-Query Error)	An attempt was made to read data in the Output Queue when it was empty. Or, the data in the Output Queue was lost before it was read.
1	Not used	
0	Operation complete (OPC-Operation Complete)	This bit becomes 1 when this instrument has processed the *OPC command.

Reading, writing, and clearing the Standard Event Status Register

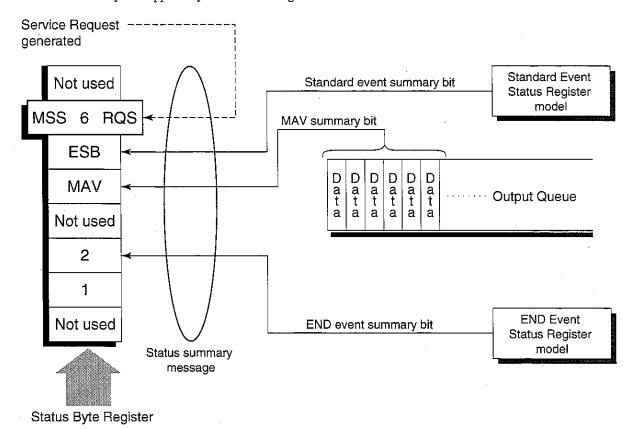

Reading	The register is read using the *ESR? command query. The register is cleared after being read. The response message is integer-format data with the binary weight added to the event bit and the sum converted to decimal.
Writing	With the exception of clearing, data cannot be written to the register from outside.
Clearing	The register is cleared when: ① A *CLS command is received ② The power is turned on Bit 7 is set to ON, and the other bits are cleared to 0 ③ An event is read for the *ESR? query command .

Reading, writing, and clearing the Standard Event Status Enable Register

Reading	The registers is read using the *ESE? command. The response message is integer-format data with the binary weight added to the event bit and the sum converted to decimal.
Writing	The register is written using the *ESE common command.
Clearing	The register is cleared when: ① An *EXE command with a data value of 0 is received ② The power is turned on The Standard Event Enable Register is not affected when: ① The device clear function status of IEEE488.1 is changed ② An *RST common command is received ③ A *CLS common command is received

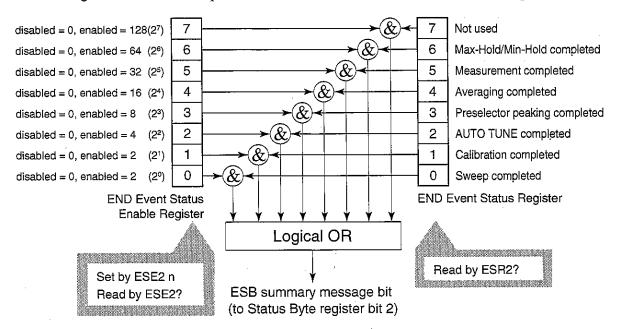

Extended Event Status Register

For the MS2665C/67C/68C, bits 7, 3, 1, and 0 are unused. Bit 2 is assigned to the END summary bit as the status-summary bit supplied by the extended register model as shown below.

Bit definition of END Event Status Register

The diagram below shows the operation and event-bit names of the END Event Status Register.

The END Event Status Enable Register on the left is used to select which bits in the corresponding Event Register will cause a TRUE summary message when set.

Bit	Event name	Description
7	Not used	Not used
6	Max Hold/Min Hold	Sweeping according to the specified HOLD number has been completed.
5	Measurement completed	Calculation processing for measurements (frequency count, noise, etc.) has been completed.
4	Averaging completed	Sweeping according to the specified AVERAGE number has been completed.
3	Preselector peaking completed	Preselector peaking has been completed
2	AUTO TUNE completed	AUTO TUNE has been completed.
1	Calibration completed	ALL CAL, LEVEL CAL, or FREQ CAL has been completed.
0	Sweep completed	A single sweep has been completed or is in standby.

Reading, writing, and clearing the Extended Event Status Register

Reading	The ESR? common query is used to read the register. The register is cleared after being read. The response message is integer-format data with the binary weight added to the event bit and the sum converted to decimal.
Writing	With the exception of clearing, data cannot be written to the register from outside.
Clearing	The register is cleared when: ① A *CLS command is received ② The power is turned on ③ An event is read for the ESR2? query command

Reading, writing, and clearing the Extended Status Enable Register

Reading	The ESE2? query is used to read the register. The response message is integer-format data with the binary weight added to the event bit and the sum converted to decimals.
Writing	The ESE2 program command is used to write the register. Because bits 0 to 7 of the registers are weighted with values 1, 2, 4, 8, 16, 32, 64, and 128, respectively, the write data is transmitted as integer-format data that is the sum of the required bit digits selected from the weighted value.
Clearing	The register is cleared when: ① An ESE2 program command with a data value of 0 is received ② The power is turned on The Extended Event Status Enable register is not affected when: ① The device clear function status of IEEE488.1 is changed ② An *RST common command is received ③ A *CLS common command is received

Techniques for Synchronizing MS2665C/67C/68C with a Controller

The MS2665C/67C/68C usually treats program messages as sequential commands that do not process newly-received commands until they complete the processing of the previous command. Therefore, no special consideration is necessary for pair-synchronization between the MS2665C/67C/68C and the controller.

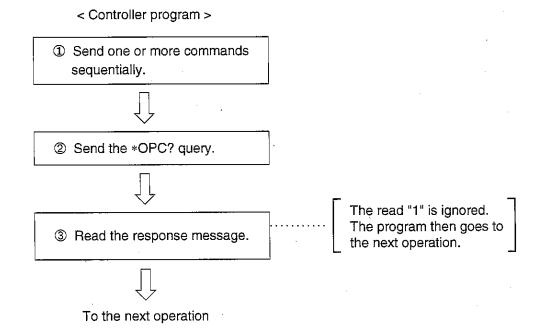

If the controller controls and synchronizes with one or more devices, after all the commands specified for the MS2665C/67C/68C have been processed, the next commands must be sent to other devices.

There are two ways of synchronizing the MS2665C/67C/68C with the controller:

- ① Wait for a response after the *OPC? query is sent.
- ② Wait for SRQ after *OPC is sent.

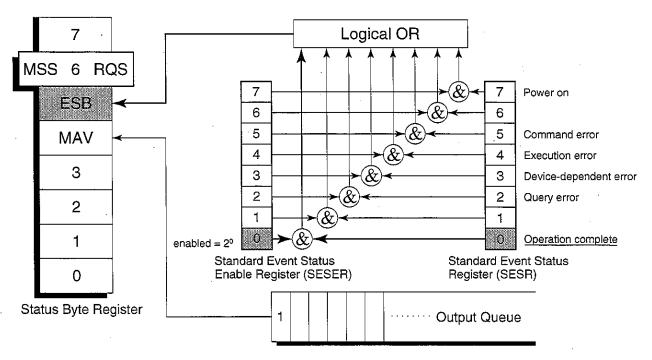

Wait for a response after the *OPC? query is sent.

The MS2665C/67C/68C outputs "1" as the response message when executing the *OPC? query command. The controller is synchronized with the MS2665C/67C/68C by waiting for the response message to be entered.

Wait for a service request after *OPC is sent (only when the GP-IB interface bus is used).

The MS2665C/67C/68C sets the operation-complete bit (bit 0) to 1 when executing the *OPC command. The controller is synchronized with the spectrum analyzer for SRQ when the operation-complete bit is set for SRQ.

SECTION 5

INITIAL SETTINGS

The MS2665C/67C/68C initializes the GP-IB interface system at three levels in accordance with the IEEE488.2 specifications. This section describes how these three levels of initialization are processed, and how to instruct initialization from the controller.

TABLE OF CONTENTS

Bus Initialization using the IFC Statement	5-4
Initialization for Message Exchange by DCL and SDC Bus Commands	5-5
Device Initialization using the *RST Command	5-6
Device Initialization using the INI/IP Command	5-7
Device Status at Power-on	5-7

SECTION 5 INITIAL SETTINGS

In the IEEE488.2 standard, there are three levels of initialization. The first level is "bus initialization," the second level is "initialization for message exchange," and the third level is "device initialization." This standard also stipulates that a device must be set to a known state when the power is turned on.

Level	Initialization type	Description	Level combination and sequence
1	Bus initialization	The IFC message from the controller initializes all interface functions connected to the bus.	Level 1 can be combined with other levels, but must be executed before level 2.
2	Initialization for message exchange	Message exchanges of all devices and specified devices on the GP-IB are initialized using the SDC and DCL GP-IB bus commands, respectively. These commands also nullify the function that reports operation completion to the controller.	Level 2 can be combined with other levels, but must be executed before level 3.
3	Device initialization	The *RST or INI/IP command returns a speci- fied device to a known device-specific state, regardless of the conditions under which it was being used.	Level 3 can be combined with other levels, but must be executed after levels 1 and 2.

When using the standard RS-232C interface port to control the MS2665C/67C/68C from the controller, the level-3 device initialization function of can be used, and the level-2 initialization function cannot be used. When using the GP-IB interface bus to control the MS2665C/67C/68C from the controller, the initialization functions of levels 1, 2, and 3 can be used.

The following paragraph describes the commands for initialization at levels 1, 2, and 3 and the items that are initialized. This paragraph also describes the known state which is set when the power is turned on.

Bus Initialization using the IFC Statement

Example

board% = 0
CALL SendIFC (board%)

■ Explanation

This function can be using when using the GP-IB interface bus is used to control the spectrum analyzer from the controller.

The IFC statement initializes the interface functions of all devices connected to the GP-IB bus line.

The initialization of interface functions involves clearing the interface function states of devices set by the controller, and resetting them to their initial states. In the table below, indicates the functions which are initialized, and indicates the functions which are partially initialized.

No	Function	Symbol	Initialization by IFC
1	Source handshake	SH	0
2	Acceptor handshake	AH	0
3	Talker or extended talker	T or TE	0
4	Listener or extended listener	L or LT	0
5	Service request	· SR	Δ
6	Remote/local	RL	
. 7	Parallel poli	PP	
8	Device clear	DC	
9	Device trigger	DT	
10	Controller	С	0

Bus initialization by the IFC statement does not affect the device operating state (frequency settings, LED on/off, etc.).

Initialization for Message Exchange by DCL and SDC Bus Commands

Example

Initializes all devices on the bus for message exchange (sending DCL).

board% = 0
addresslist% = NOADDR
CALL DevClearList(board%, addresslist%)

Initializes only the device at address 3 for message exchange (sending SDC).

board% = 0
address% = 3
CALL DevClear(board%, address%)

■ Explanation

This function can be used when the GP-IB interface is used to control the spectrum analyzer from the controller. This statement executes initialization for message exchange of all devices or a specified device on the GP-IB having the specified select code.

Items to be initialized for message exchange

When the spectrum analyzer accepts the DCL or SDC bus command, it does the following:

(1) Input buffer and Output Queue:

Clears them and also clears the MAV bit.

(2) Parser, Execution Controller,

and Response Formatter:

Resets them.

(3) Device commands including *RST:

Clears all commands that prevent these commands from

being executed.

(4) Processing of the *OPC? command:

Puts a device in OCIS (Operation Complete Command Idle State). As a result, the operation complete bit cannot be set

in the Standard Event Status Register.

(5) Processing of the *OPC? query:

Puts a device in OQIS (Operation Complete Query Idle State). As a result, the operation complete bit 1 cannot be set in the

Output Queue.

(6) Device functions:

Puts all functions associated with message exchange in the idle state. The device continues to wait for a message from

the controller.

CAUTION

The following are not affected even if the DCL and SDC commands are processed.

- (1) Current data set or stored in the device
- (2) Front panel settings
- (3) Status of status byte other than MAV bit
- (4) device operation in progress

Device Initialization using the *RST Command

■ Syntax

*RST

■ Example

For RS-232C

WRITE #1, "*RST" Initializes the device (Spectrum Analyzer) at address 1 at level 3.

For GPIB

SPA%=1

CALL Send(0,SPA,"*RST",NLend)

■ Explanation

The *RST (Reset) command is an IEEE488.2 common command that resets a device at level 3.

The *RST (Reset) command is used to reset a device (Spectrum Analyzer) to a specific initial state. For details of the items that are initialized and the settings after initialization, see Appendix A.

Note: The *RST command does not affect the following.

- (1) IEEE488.1 interface state
- (2) Device address
- (3) Output Queue
- (4) Service Request Enable register
- (5) Standard Event Status Enable register
- (6) Power-on-status-clear flag setting
- (7) Calibration data affecting device specifications
- (8) Parameters preset for control of external device, etc.

For details of the settings of the spectrum analyzer after initialization, see Appendix A.

Device Initialization using the INI/IP Command

■ Syntax

INI

ΙP

■ Example (program message)

Explanation

The INI and IP commands are the MS2665C/67C/68C device-dependent messages that initialize a device at level 3.

For details of the items that are initialized by the INI and IP commands, and the settings after initialization, see Appendix A.

Device Status at Power-on

When the power is turned on:

- (1) The device is set to the status it was in at power-off.
- (2) The Input Buffer and Output Queue are cleared.
- (3) The Parser, Execution Controller, and Response Formatter are initialized.
- (4) The device is put into OCIS (Operation Complete Command Idle State).
- (5) The device is put into OQIS (Operation Complete Query Idle State).
- (6) The Standard Event Status and Standard Event Status Enable Registers are cleared. Events can be recorded after the registers have been cleared.

As the special case of (1), when the spectrum analyzer is powered on for the first time after delivery, the spectrum analyzer settings are those listed in the Initial Settings Table (Appendix A).

SECTION 6

SAMPLE PROGRAMS

This section gives some examples of the Microsoft Quick Basic program that controls the MS2665C/67C/68C from a personal computer which is used as a controller.

Note: Microsoft Quick Basic is a trade mark of the Microsoft Corporation.

SECTION 6 SAMPLE PROGRAMS

Precautions on Creating the Remote Control Program

Note the following points when writing remote control programs.

No.	Precaution	Description
1	Be sure to initialize each device.	each device. When a command other than the INPUT #statement is sent to the controller before the response to a query is read, the output buffer is cleared, and the response message disappears. For this reason, write the INPUT #statement in immediate succession to a query.
2	Do not send any command (related to the device) other than the INPUT #statement immediately after sending a query.	No.2 described above is one type of exception processing of the protocol. Avoid exception processing from occurring as requested. Avoid stoppage of execution caused by an error by providing a program with exception-processing section against exceptions that can be foreseen.
3	Create a program that avoids the exception processing of the protocol.	There may be a number of the state in which each device is not proper to be actually sued due to operation on its own panel or execution of other programs. It is necessary to using individual devices with a prescribed condition resulting from initializing them. Execute initialization (INIT or *RST) of the functions proper to
4	Protect RS-232C buffer overflow.	The RS-232C interface has a 512-byte data area as the internal receive buffer. The buffer overflow may occur depending on the processing. To protect the overflow, don't send a large amount of data(i.e. control commands) at a time for remote control using RS-232C. After sendind a command group, send *OPC? command to check the response for the synchronization before sending the next command.

Sample Programs

Initializing

<Example 1> Initializes the MS2660 series

```
' MS2660 series Sample program
  <<Initialize>>
<sup>ݛ</sup>┽┼┼┼┼┼┼┼<del>╎┆╇╇╇╇╇╇╇╇</del>╇╇╇╇╇╇╇╇╇╇╇╇╇
 Setup parameter of PC Com. port
   BAUD
              :24ØØ BPS
              : NONE
   Parity
   Data bit
              : 8 bits
   Stop bit
              : 1 bit
   Terninator : LineFeed
OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
PRINT #1, "INI"
                  Initialize MS2660 series Spectrum Analizer
END
```

The parameters initialized by the above program are shown in Appendix A.

There is a '*RST' command in another command for executing initialization. The '*RST' command is used to execute initialization over a wider range. For the range of initialization level, see SECTION 5. The usage of the 'IP' command is identical to the 'INI' command.

For general usage of INI and *RST, first initialize the MS2665C/67C/68C device functions with the IP or INI command, then use the program commands to set only the functions to be changed. This prevents the spectrum analyzer from being controlled while unnecessary functions are set.

Reading the frequency and level at marker point

<Example 2> Sets the center frequency to 500 MHz and span to 10 MHz, then displays the frequency and level reading at the peak point on the controller screen when a signal to be measured is received.

```
2 ' MS2660 series Sample program
3 ' <<Read out marker frequency & level>>
5 1
6 ' Setup parameter of PC Com. port
 8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
1Ø PRINT #1, "INI"'
                          Initialize Spectrum Analyzer
11 '
12 PRINT #1, "CF 500MHZ"'
                         Center fequency :500MHz
13 PRINT #1, "SP 10MHZ"'
                         Span frequency :10MHz
14 PRINT #1, "TS"
                          Take a sweep
15 '
16 PRINT #1, "PCF"
                          Set peak to center frequency
17 PRINT #1, "PRL"
                          Set peak to reference level
18 PRINT #1, "MKPK"'
                          Search peak
19 '
2Ø PRINT #1, "MKF?"!
                          Query marker frequency
21 INPUT #1, FREQ'
                          Input marker frequency data
22 PRINT #1, "MKL?"'
                          Query marker level
23 INPUT #1, LEVEL'
                          Input marker level data
24 1
25
                          Print out the result (Frequency/Level)
                      Frequency=####.## MHz"; FREQ/1000000
26 PRINT USING "Marker
27 PRINT USING "Marker LEVEL=####.## dBm"; LEVEL
28 '
29 END
```

The center frequency and frequency span are set at line 12 and line 13 respectively. The TS sweep command at line 14 does not execute the next message unless the sweep is completed. This command thus prevents the peak search and other program lines from being executed before the sweep is completed.

The PCF and PRL commands at lines 16 and 17 operate as follows: The former sets the peak point on the screen to the center frequency, and the latter sets its peak level center frequency to the reference level.

The "MKF?" and "MKL?" at lines 20 and 22 query the frequency and level at the marker point respectively, and the data is read with the INPUT#statement on the next line. When a command other than the INPUT#statement is sent before the response to a query is read, the output buffer is cleared, and the response message is deleted. For this reason, write the INPUT#statement immediately after a query.

Program execution result of <Example 2>

Marker Frequency=501.251 △ MHz Marker LEVEL=-15.53dBm

Note: \triangle is a space.

Reading trace data

<Example 3-1> Reads the trace level at all points when CF and SPAN are set to 500 MHz and 10 MHz respectively.

```
2 ' MS2660 series Sample program
3 ' <<Read out trace data(ASCII)>>
5 1
6 ' Setup parameter of PC Com. port
7 '
8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
1Ø PRINT #1, "INI"
                     Initialize Spectrum Analyzer
12 PRINT #1, "CF 500MHZ"'
                          Center fequency :500MHz
13 PRINT #1, "SP 10MHZ"'
                          Span frequency :10MHz
14 PRINT #1, "TS"
                          Take a sweep
15 '
16 DIM TRACE(5Ø1)'
                          Define read data area
17 PRINT #1, "BIN Ø"'
                         Set read out data type to ASCII
י 18
19 FOR I = \emptyset TO 5\emptyset\emptyset'
                          Repeat trace(Ø) to trace(500):501 points
2Ø PRINT #1, "XMA? " + STR$(I) + ",1"' Query trace data
21 INPUT #1, TRACE(I)'
                         Read out trace data
                          Print out trace data
22 '
23 PRINT USING "###.##dBm"; TRACE(I) / 100
24 NEXT I
25 '
26 END
```

The "BIN_0" at line 17 is a command for specifying ASCII as the response data format. The ASCII or BINARY transfer format can be specified for the "XMA?", "XMB?", "XMG?", and "XMT?" queries for reading trace data.

The example 3-2 blocks the trace data at every 10 points, and reads it.

<Example 3-2> Blocks the trace data at every 10 points, and reads it.

```
2 ' MS2660 series Sample program
3 ' <<Read out trace data(ASCII) BLOCKING>>
 6 ' Setup parameter of PC Com. port
 7 '
8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
9 1

                         Input Delta marker level data
                          Print out the result (Frequency/Level)
26 PRINT USING "Delta Frequency=####.### MHz"; DFREQ / 1000000
27 PRINT USING "Delta
                        level=####.## dB"; DLEVEL
28 '
29 END
```

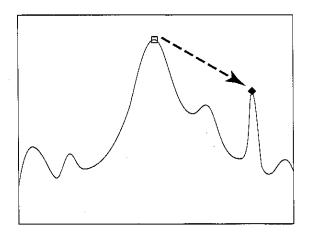

The "MKR_1" at line 18 is used to set the marker mode to DELTA, so that the reference marker can also be set together to the current marker position.

The "MKPK_NH" at line 19 sets the marker search to NEXT PEAK to move the current marker to NEXT PEAK point.

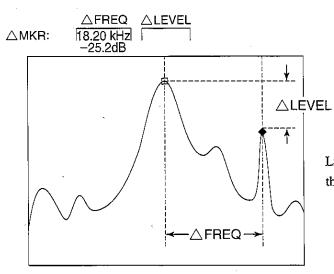

The "MKF?" and "MKL?" at lines 21 and 23 query reading the frequency and level at the current marker position while the marker mode is NORMAL. It is also used to query reading the frequency and level differences between the current marker and the reference marker while the marker mode is DELTA.

Executing PEAK SEARCH (MKPK) at line 17 allows the current marker to be set to the peak point.

Line 19 allows the reference marker to be set together to the current marker position. Executing NEXT PEAK SEARCH MKPK_NH at line 18 allows the current marker

Lines 21 to 24 read out the FREQ and LEVEL displayed in the upper left of screen.

Multimarker function

<Example 5-1> Using the multimarker function, measures the frequency/level at 10 points in descending order.

```
2 ' MS2660 series Sample program
3 ' <<Multi Marker Highest-10>>
5
6 ' Setup parameter of PC Com. port
8 OPEN "COM1:2400, N, 8, 1, CD500, DS0, LF" FOR RANDOM AS #1
9 1
                          Initialize Spectrum Analyzer
10 PRINT #1, "INI"'
11 '
12 PRINT #1, "CF 500MHZ"'
                          Center fequency 500MHz
13 PRINT #1, "SP 20KHZ"'
                          Span frequency 20KHz
14 PRINT #1, "TS"'
                          Take a sweep
15 '
16 PRINT #1, "MKMHI"'
                          Multi marker On &
                          Perform Highest-10 function
17 '
18 '
19 FOR I = 1 TO 10
20 PRINT #1, "MKMP? " + STR$(I)
21 INPUT #1, FREO'
                          Input marker frequency data
22 PRINT #1, "MKML? " + STR$(I)
23 INPUT #1, LEVEL'
                          Input marker frequency data
25 PRINT USING "Marker No. ## #,###.####MHz ####.##dBm"; I; FREQ / 10000000;
LEVEL
26 NEXT I
27 '
28 END
```

The MS2665C/67C/68C multimarker function allows up to ten markers to be set at a time. The "MKMHI" at line 130 is used to set the multimarker to HIGHEST 10 mode which sets up to ten markers in descending order.

The frequency and level at each marker are read out by lines 19 to 26.

This program allows harmonics to be observed if the program is modified. <Example 5-2> shows the program for observing the harmonics from a fundamental to the fifth order.

<Example 5-2> Harmonic frequency measurement (measures 500 MHz fundamental and up to its fifth order harmonics)

```
2 ' MS2660 series Sample program
3 ' <<Multi Marker Harmonics>>
5
6 ' Setup parameter of PC Com. port
8 OPEN "COM1:2400, N, 8, 1, CD500, DS0, LF" FOR RANDOM AS #1
9 1
                          Initialize Spectrum Analyzer
1Ø PRINT #1, "INI"'
11 '
12 PRINT #1, "FA ØHZ"
                          Start fequency : ØHz
13 PRINT #1, "FB 3GHZ"'
                          Stop frequency :3GHz
14 PRINT #1, "MKZF 500MHZ"'
                          Marker center :500MHz
15 PRINT #1, "TS"'
                          Take a sweep
16 '
17 PRINT #1, "MKMHRM"'
                          Multi marker On & Perform harmonics function
18 '
19 FOR I = 1 TO 5
20 PRINT #1, "MKMP? " + STR$(I)
21 INPUT #1, FREQ'
                          Input marker frequency data
22 PRINT #1, "MKML? " + STR$(I)
                          Input marker frequency data,
23 INPUT #1, LEVEL'
25 PRINT USING "Marker No. ## #,###.###MHz ####.##dBm"; I; FREQ / 10000000;
LEVEL
26 NEXT I
27 1
28 END
```

This program allows the frequency to be set using the START-STOP at lines 12 and 13. The "MKZF_500MHZ" at line 14 moves the zone marker center to 500 MHz so that marker can capture a fundamental. (In the initial state, the zone is positioned in the center of the screen. The "MKMHRM" at line 17 sets the multimarker to HARMONICS mode (harmonic frequency measurement).

Respective frequencies and levels at five markers can be read out by setting the number of loops to 5 in the FOR...NEXT statement from line 19 to line 26. The other parts of this program are the same as <Example 5-1>.

Gate functions

<Example 6> Reads out spectrum data by observing the burst wave using the gate function.

```
2 ' MS2660 series Sample program
3 ' <<Gate sweep>>

3Ø NEXT I
31 '
32 END
```

When the burst waveform shown in Fig. 6-1 is observed, the spectrum shown in Fig. 6-2 (a) is output. This function can conveniently be used to observe the spectrum of the ON interval (interval shown by A in Fig. 6-1) in this waveform. This program uses the wide IF video trigger signal as a gate source signal.

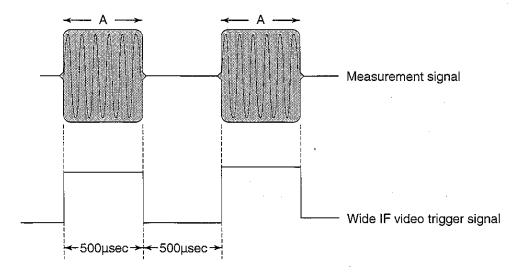

Fig. 6-1 Burst Waveform

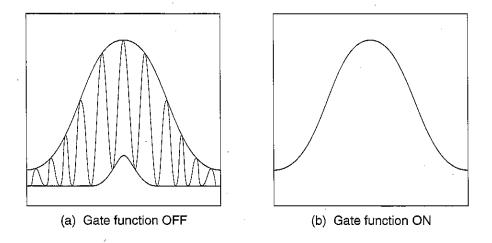

Fig. 6-2 Burst Wave Spectrum

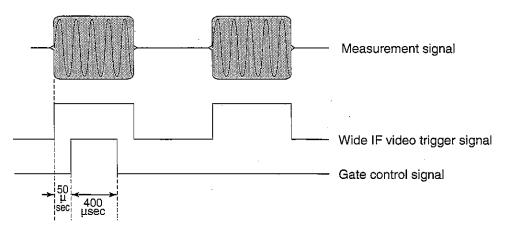

Fig. 6-3 Sample Program for Gate-Control Signal Generation Timing

The RBW command at line 16 sets RBW to the optimum value depending on the GATE conditions (GATE DELAY: t1, GATE LENGTH: t2) as shown in Table 6-1 below.

The block from line 17 sets the trigger signal, and the block from lines 18 to 20 sets the gate conditions. The gate function is set to ON at line 21. The waiting time is granted at liens 23 and 24 because it takes time to form a perfect waveform which is fully connected.

The block from liens 26 to 30 allows trace data to be output by the "XMA?" query. The spectrum can be observed as shown in Fig. 6-2(b) by executing this program.

Table 6-1 RBW Optimum Values

RBW	t ₁	t ₂	ta
1 kHz	≥3 ms		
3 kHz	≥1 ms		
10 kHz	≥230 µs		
30 kHz	≥200 µs	≥20 µs	≥1 µs
100 kHz	≥20 µs		
300kHz	≥15 µs		
1 MHz 3 MHz	≥10 µs		

(Blank)

Saving and recalling data

<Example 7> Saves and recalls data to and from memory card.

Saving data

```
2 ' MS2660 series Sample program

1Ø GOSUB RCLMEMCARD'
                                 Call recall subroutine
11 END
14 ' Recall from memory card SUBROUTINE
```

```
16 RCLMEMCARD:
17 '
18 PRINT #1, "PMCS SLOT1"'
                                              Recall slot :Slot1(Upper)
19
                                              Enter recall data type
20 INPUT "SELECT RECALL DATA 1=TRACE&PARAM
                                             2=PARAM"; RCD
21 IF RCD = 2 THEN RCDATA$ = "P" ELSE RCDATA$ = "TP"
22 PRINT #1, "RDATA" + RCDATA$!
                                              Set recall data type
23 '
24 INPUT "FILE No."; FILE!
                                              Enter recall file No.
25 PRINT #1, "RCM" + STR$(FILE);
                                              Perform recall procces
26 RETURN
```

These two programs are used as subroutines called from other programs. Each subroutine can be called by placing GOSUB SAVMEMCARD or GOSUB RCLMEMCARD at the line number where the program data is to be saved or restored.

<Example>

```
200 PRINT #1,"SWP"
210 GOSUB SAVMEMCARD
```

The block from lines 19 and 20 of SAVMEMCARD sets the title. When the saved data is displayed if the title has been set, this title is also displayed. This can conveniently be used to find data.

The block from lines 22 sets the media to be used for saving to the internal memory card in slot 1 (upper side).

FILE No. is input at line 23 and data is saved to the FILE No. at line 24.

Line 20 of RCLMEMCARD selects the data to be recalled for trace data including parameters or parameters only. Line 22 declares the item to be recalled, and the specified file is recalled at lines 24

Adjacent-channel leakage power measurement

<Example 8> Subroutine for adjacent-channel leakage power measurement

```
2 ' MS2660 series Sample program
3 ' <<Adj ch Power measure>>
6 ' Setup parameter of PC Com. port
8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1

41 PRINT USING "Lower side CH2 Level=###.###dBm"; LWLVL2
42 PRINT USING "Upper side CH3 Level=####.###dBm"; UPLVL2
43 '
44 RETURN
```

This ADJ program is a subroutine, which requires the center frequency and frequency span to be set to appropriate values in the main program. Then it is executed.

The block from lines 23 to 26 sets adjacent-channel measurement conditions, which is both the upper and lower channels, the 8.5 kHz channel width, 12.5 kHz channel 1 separation, and 25.0 kHz channel 2 separation. After the sweep is executed by the "TS" command at line 29, the adjacent-channel leakage power is measured at line 30. Line 32 queries reading the measured value at line 33.

The program in <Example 8> for measuring a modulated wave relative to the total power can be changed to a program for measurement relative to the reference level by rewriting line 27 as shown below:

PRINT #1, "MADJMOD UNMD"

In this case, perform the following operations before activating this subroutine.

Put the input signal in the unmodulated state and execute PEAK -> CF and PEAK -> REF. Then return to the modulated state.

Occupied frequency bandwidth measurement

<Example 9> Subroutine for occupied frequency bandwidth measurement using N% of POWER method

```
2 ' MS2660 series Sample program
3 ' <<Occ BW measure>>
5 '
6 ' Setup parameter of PC Com. port
7 '
8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
9 1
1Ø PRINT #1, "INI"'
                        Initialize Spectrum Analyzer
                        Center fequency :500MHz
12 PRINT #1, "CF 500MHZ"'
13 PRINT #1, "SP 50KHZ"'
                       Span frequency :50kHz
                       Call Occ BW measure subroutine
15 GOSUB OBW'
16 END
17 '
19' OBW MEASURE SUBROUTINE
21 OBW:
22 '
23 PRINT #1, "MOBW N"'
                        OccBW measure method : n% method
24 PRINT #1, "OBWN 99"'
                        n%
                                          : 99%
25 PRINT #1, "DET SMP";
                        Detection mode
                                         : Sample
26 PRINT #1, "VAVG 16"'
                        Average sweep count : 16
27 PRINT #1, "VAVG ON"
                        Average sweep On
29 PRINT #1, "TSAVG"'
                       Take average sweep
31 PRINT #1, "MEAS OBW, EXE" 'Perform OccBW measure
33 PRINT #1, "RES?"'
                        Query the result
34 INPUT #1, OBWFREQ, CNTRFRQ'
                           Read out the result data
                         response-1:Occ BW frequency
37 '
                        response-2: Signal center frequency
39 PRINT USING "CENTER FREQ=#### ###MHz"; CNTRFRQ / 10000000!
4Ø PRINT USING "##*BW FREQ=####.##kHz"; NPC; OBWFREQ / 1000
41 '
42 RETURN
```

Line 24 sets the N% value to set n = 99% in <Example 9> by sending the OBWN command for setting the occupied frequency bandwidth to Spectrum Analyzer at line 23 and 24. Line 25 sets the detection mode to SAMPLE. Line 26 set the averaging count and line 27 averaging to ON respectively.

Line 29 issues the "TSAVG command to repeat the sweep by the required number of times for averaging processing. Line 31 measures the occupied frequency bandwidth of the averaging-processed waveform. Line 33 queries reading the occupied frequency bandwidth and the center frequency of the frequency bandwidth at line 34.

To make a measurement using X dB DOWN, rewrite lines 23 and 24 as shown below:

PRINT @SPA; "OBWXDB 25" PRINT @SPA; "MOBW XDB"

Setting template data

<Example 10> Subroutine for template data

```
2 ' MS2660 series Sample program
3 ' <<Makeup template>>

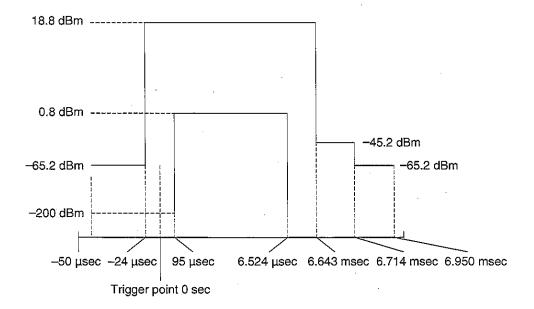

Fig. 6-4 Setting Data

The block from line 18 selects the template No. to be set. The block from line 19 specifies the template data as an absolute value. The block from lines 20 and 21 initializes the current data settings. The block from lines 23 and 37 to 42 sets LIMIT LINE 1 UPPER. Line 23 sets the data to be set in LIMIT LINE1 UPPER. Line 24 specifies the line where setting data is written.

Line 37 reads the number of data points to set the number of loops to N in the FOR ...NEXT statement at lines 38 to 42. Various data settings are read in the FOR...NEXT block.

The block from lines 44 and 54 to 59 sets LIMIT LINE 1 LOWER like the block from lines 23 and 37 to 42.

The block from lines 26 to 35 and 47 to 52 contains the DATA statements for setting the data included in these lines as template data. Lines 26 and 47 are label lines for the RESTORE statement.

Each data item in lines 27 and 48 is numeric, and shows the number of data points. In the DATA statements following the DATA statement with this numeric data, the string expressions are listed as string data with units in order of time and level.

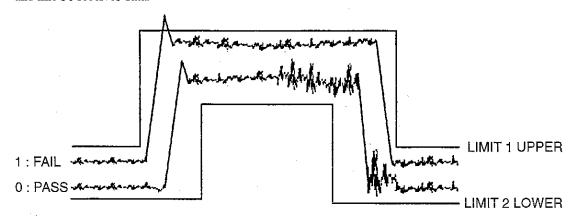

Measuring template

<Example 11> Subroutine for template measurement

```
2 ' MS2660 series Sample program
 3 ' <<Check template limit>>
 5 '
 6 ' Setup parameter of PC Com. port
 8 OPEN "COM1:2400,N,8,1,CD500,DS0,LF" FOR RANDOM AS #1
1Ø PRINT #1, "INI"'

 6Ø ELSE
       PRINT " CHECK FAIL!"
 8Ø END IF
 9Ø '
 91 RETURN
```

This subroutine checks whether or not a burst signal waveform satisfies the specification using the set template data.

Line 29 specifies the template No. used for a go/no-go decision. Line 30 and 31 specify LIMIT 1 UPPER and LIMIT 1 LOWER as limit lines respectively. Line 33 executes template measurement, line 35 requests data, and line 36 receives data.

When part of a waveform is beyond LIMIT LINE, a response of "1" is generated to indicate FAIL. When the waveform is not beyond LMIT LINE, a response of "0" is generated to indicate PASS.

Burst wave average power measurement

<Example 12> Subroutine for burst wave average power measurement Fig.

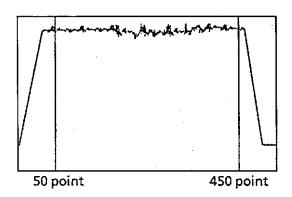

```
2 ' MS2660 series Sample program
3 ' <<Burst power measure>>
6 ' Setup parameter of PC Com. port

35 INPUT #1, PWRDB, PWRW'
                             Read out the result
37 PRINT USING "####.##dBm ####.##mW"; PWRDB; PWRW / 1E+Ø9
38 RETURN
```

This program is a subroutine that measures the burst wave average power.

Lines 29 and 30 set the measurement start and stop points on the screen display.

The average power is measured at line 32.

Data can be obtained as a value with dBm units or pW UNITS.

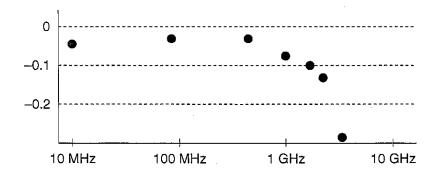

When a waveform is displayed on the screen as shown in the left diagram (TIME domain), the average power between 50 point and 450 point is measured

Before calling the subroutine, lines 12 to 18 set the center frequency, time delay, etc. to execute the sweep.

Frequency characteristic correction data setting

<Example 13> 2 ' MS2660 series Sample program 3 ' <<Makeup correction factor table>> 5 ' 6 ' Setup parameter of PC Com. port 8 OPEN "COM1:2400, N, 8, 1, CD500, DS0, LF" FOR RANDOM AS #1 1Ø GOSUB MAKECORR' Call makeup correction factor table subroutine 11 END 12 ' 14 ' makeup correction factor table SUBROUTINE 16 MAKECORR: 17 ' 18 PRINT #1, "CORR 1"' Select template No. 1 for making template 19 PRINT #1, "CORC" Initialize Limit line-1 upper data 18 ' 19 RESTORE CORRDATA 20 '== correction factor data == 21 CORRDATA: 22 DATA 7: ' correction factor data count 23 DATA "10MHZ", "-0.04DB": 24 DATA "100MHZ", "-0.03DB": 25 DATA "500MHZ", "-0.03DB": 26 DATA "1GHZ", "-Ø.Ø8DB": 27 DATA "1.5GHZ", "-Ø.1ØDB": 28 DATA "2GHZ", "-Ø.13DB": 29 DATA "3GHZ", "-Ø.29DB": 3Ø ' 31 READ N 32 FOR $I = \emptyset$ TO N - 1Read each correction factor data 33 ' & write to limit line area 34 ' 35 READ FR\$, LEV\$ 36 PRINT "CORD " + STR\$(I) + "," + FR\$ + "," + LEV\$ 37 PRINT #1, "CORD " + STR\$(I) + "," + FR\$ + "," + LEV\$ 38 NEXT I 39 '

4Ø RETURN

The line 18 selects the correction No. to be set.

The line 19 initializes the correction data being set currently.

The line 21 specifies the line on which data to be set is written.

The lines 25 to 31 specifies the correction data to be set together with the frequency and level data.

The lines 33 to 40 is the frequency characteristic correction data setting section.

The line 33 reads the number of data items to be set. The block from lines 34 to 40 writes the correction data in the loop of the FOR --- NEXT statement. Note that the data No. starts from 0.

When this subroutine MAKECORR executed, the set correction data is written. The frequency correction processing is validated from the subsequent sweep after setting.

Precautions on Creating the GPIB Program

Note the following points when writing remote control programs using GPIB Interface.

No.	Precaution	Description
1	Be sure to initialize each device.	There may be a number of the state in which each device is not proper to be actually used due to operation on its own panel or execution of other programs. It is necessary to using individual devices with a prescribed condition resulting from initializing them. Execute the following. ① Initializing the interface functions (Send IFC) ② Initializing message exchange functions of each device (DevClear) ③ Initializing the functions proper to each device (INI or *RTS)
2	Do not send any command (related to the device) other than the Receive @ statement immediately after sending a query.	If MLA is received when a command other than the Receive @ statement is sent to the controller before the response to a query is read, the output buffer is cleared, and the response message disappears. For this reason, write the Receive @ statement in immediate succession to a query.
3	Create a program that avoids the exception processing of the protocol.	Avoid stoppage of execution (caused by an error) by means of providing a program with exception-processing section against exceptions that can be foreseen.
4	Confirm the interface function of each device (subset).	Execution of program does not advance if necessary subset (s) has (have) not been prepared in the device. Be sure to confirm the subset (s) of each device. Also confirm that each device complies with IEEE488.2.

Initializing (GPIB)

<Example 14> Initializes the MS2660 series.

```
2 ' MS2660 series GPIB control sample program
    <<Initialize GPIB bus & MS2660 Series>>
5 REM $INCLUDE: 'C:\\YAT-GPIB\\QBASIC\\QBEDECL.BAS'
6 DECLARE SUB gpiberr (msg&)
,7
8 SPA% = 1'
           Set SPA GPIB adress
9 CALL SendIFC(Ø)'
                   Send GPIB bus interface clear
10 CALL DevClear(0, SPA%)'
                      Send DeviceClear to MS2660 Series
11 CALL Send(Ø, SPA%, "IP", NLend)'
                               Send Initialize comand "IP"
12 END
13 '
```

- Line 9: Interface-clears GPIB bus.
- Line 10: Specifies MS2665C/2667C address, and sends device-clear.
- Line 11: Sends "IP" command to for initialization.

There is a '*RST' command in another GPIB command for executing initialization. The '*RST' command is used to execute initialization over a winder range. For the range of initialization level, see SECTION 5. The usage of the 'IP' command is identical to the 'INI' command.

For general usage of INI and *RST, first initialize the MS2665C/2667C device functions with the IP or INI command, then use the program commands to set only the functions to be changed. This prevents the MS2665C/2667C from being controlled while unnecessary functions are set.

Reading trace data (GPIB)

<Example 15> Performs the same operation as Example 3-1, using GPIB.

```
2 ' MS2660 series GPIB control sample program i
3 ' << Read out Trace data>>
5 REM $INCLUDE: 'C : \AT-GPIB\QBASIC\QBDECL.BAS'
6 DECLARE SUB gpiberr (msg$)
8 SPA% = 1'
                                        Set SPA GPIB address
9 '
          Initialize GPIB bus & MS2660 Series
1Ø '
11 CALL SendIFC(Ø)
12 CALL DevClear (Ø, SPA%)
13 CALL Send(Ø, SPA%, "IP", NLend)
14 '
15 '
16 CALL Send(Ø, SPA% "CF 500MHZ", NLend)' Center frequnecy :500MHz
17 CALL Send(Ø, SPA%, "SP 1ØMHZ", NLend)' Span frequnecy :1ØMHz
18 CALL Send(Ø, SPA%, "TS", NLend)
                                        Take a sweep
19 '
                                        Define read data area
2Ø DIM TRACE (5Ø1) '
21 CALL Send(Ø, SPA%, "BIN Ø", NLend)'
                                       Set read out data type to
22 '
                                       Repeat trace(0) to
23 FOR I = \emptyset TO 5\emptyset\emptyset'
trace(500):501 points
24 \text{ CMD}$ = "XMA?" + STR$(I) + ",1"
25 CALL Send(Ø, SPA%, CMD$, NLend)' Query trace data
26 '
27 DATA$ = SPACE$(100)
28 CALL Receive(Ø, SPA%, DATA$, NLend)' Read out trace data
                                         Store readout data to trace
3\emptyset TRACE(I) = VAL(DATA$)'
data area
31 '
                                         Print out trace data
32 PRINT USING "Trace-A(###) ####.##"; I; TRACE(I)/100
33 NEXT I
34 '
35 '
36 END
```

Lines 11 to 13: Initializes GPIB bus and MS2665C/67C/68C.

CALL Send() statements after line 13:

Sends MS2665C/67C/68C commands. Command termination code is specified to NLend (line-feed code, New-Line or LF).

CALL Receive() statements at line 28:

Reads out trace data from MS2665C/67C/68C.

Termination code of the read data is specified to NLend.

Line 30: Converts the read character-string data to numeric data, and stores it at trace-data store area.

SECTION 7

TABLES OF DEVICE MESSAGES

This section gives information about the device messages of the MS2665C/67C/68C in the form of tables. The messages are arranged according to function, as shown below. For detailed descriptions of commands, see SECTION 8, "DETAILED DESCRIPTIONS OF COMMANDS."

SECTION 8 ETAILED DESCRIPTION OF COMMANDS

This section gives detailed descriptions of the device messages for the MS2665C/67C/68C spectrum analyzer in alphabetical order.

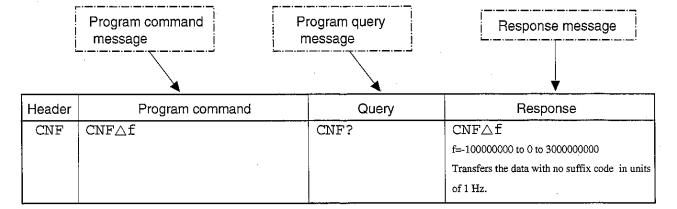

CNF

Center Frequnecy

Function

Sets the center frequency (same function as CF).

- Value of f
- -100MHz to 3.0GHz
- Suffix code

None:

 $Hz(10^{0})$

HZ:

 $Hz(10^{0})$

KHZ, KZ:

 $kHz(10^3)$

MHZ, MZ:

MHz(10⁶)

GHZ, GZ:

GHz(10^9)

• The data to the left of the colon is part of the program or response data

Device-dependent initial setting value

• The data is to the right of the colon.

Initial setting

Value of f=1.50 GHz

■ Example

CNF△123456

CNF△5ØMHz

CNF?

■ Restrictions according to the model type and options None

A1

A1

Trace A Write ON

■ Function

Clears trace A waveform data to set the write mode to ON (same function as $AWR\triangle1/CLRW\triangle TRA$).

Header	Program command	Query	Response
A1	A1		
,			

■ Example

A1

A2

A2

Trace A Max Hold

■ Function

Controls writing of the waveform data to trace BG.

Header	Program command	Query	Response
A2	A2		

■ Example

Δ2

AAT

AAT RF Attenuator

■ Function Switches the RF attenuator setting mode to AUTO or MANUAL.

Header	Program command	Query	Response
AAT	AAT△sw	AAT?	AAT_sw
;			

■ Value of sw

Ø: MANUAL

1: AUTO

■ Suffix code

None

■ Initial setting

1:AUTO

■ Example

AAT∧1

ADJCH

ADJCH Adjacent CH Select

■ Function

Selects the subject channel to be calculated for an adjacent channel.

Header	Program command	Query	Response
ADJCH	ADJCH∆a	ADJCH?	а

■ Value of a

BOTH:

BOTH SIDES

UP:

UPPER SIDE

LOW:

LOWER SIDE

OFF:

OFF

■ Suffix code

None

■ Initial setting

BOTH:

BOTH SIDES

■ Example

ADJCH_BOTH

ADJCH_LOW

ADJCHBW

ADJCHBW

Adjacent CH Bandwidth

■ Function

Sets the bandwidth of the adjacent channel.

Header	Program command	Query	Response
ADJCHBW	ADJCHBW△f	ADJCHBW?	f f=10 to 9999990 Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

10 Hz to 9.99999 MHz (10 Hz resolution. Data below 10 Hz is truncated.)

■ Suffix code

None:

Hz(10^0)

HZ:

 $Hz(10^{0})$

KHZ, KZ:

kHz(10³)

MHZ, MZ: GHZ,GZ: $MHz(10^{6})$ GHz(10^9)

Initial setting

■ Example

8.5kHz 8.5KHZ:

ADJCHBW∧8.5KHZ

ADJCHSP

ADJCHSP

Adjacent CH Sepalation

■ Function

Sets the separation of adjacent channel 1.

Header	Program command	Query	Response
ADJCHSP	ADJCHSP∆f	ADJCHSP?	f=0 to 9999990 Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

0 Hz to 9.99999 MHz (10 Hz resolution. Data below 10 Hz is truncated.)

■ Suffix code

None:

 $Hz(10^{0})$

HZ:

Hz(10^0)

KHZ, KZ:

kHz(10³)

MHZ, MZ: GHZ, GZ: $MHz(10^{6})$

GHz(10^9)

■ Initial setting

12.5KHZ: 12.5kHz

■ Example

ADJCHSP△12.5kHz

ADJCHSPF

ADJCHSPF Adjacent CH2 Separation

■ Function

Sets the separation of adjacent channel 2.

Header	Program command	Query	Response
ADJCHSP	ADJCHSPF∆f	ADJCHSPF?	f
			f=0 to 9999990
			Transfers the data with no suffix code in unit of 1 Hz.

■ Value of f

0 Hz to 9.99999 MHz (10 Hz resolution. Data below 10 Hz is truncated.)

Suffix code

None:

Hz(10^0)

HZ:

Hz(10^0)

KHZ, KZ:

kHz(10^3)

MHZ, MZ: GHZ, GZ:

MHz(10^6)

■ Initial setting 12.

GHZ,GZ: GHz(10^9) 12.5KHZ: 12.5kHz

■ Example

ADJCHSPF△12.5kHz

ADJINBW

ADJINBW Adjacent Inband CH Bandwidth

■ Function

Sets the bandwidth of the adjacent inband channel

Header	Program command	Query	Response
ADJINBW	ADJINBW∆f	ADJINBW?	f f=10 to 9999990
			Transfers the data with no suffix code in unit of 1 Hz.

■ Value of f

10Hz to 9.99999 MHz (10Hz resolution, Data below 10Hz is truncated)

■ Suffix code

None:

Hz(10⁰)

HZ:

Hz(10^0)

KHZ, KZ:

kHz(10^3)

MHZ,MZ:

MHz(10^6)

GHZ,GZ:

GHz(10^9)

■ Initial setting

8.5KHZ:

8.5kHz

■ Example

ADJINBW△8.5kHz

AMB

AMB

 $A - B \rightarrow A$

■ Function

Finds the difference between Trace-A and Trace B, and saves the result in Trace-B.

Header	Program command	Query	Response	
AMB	AMB∆sw	AMB?	sw	sw=0,1

■ Value of sw

1, ON: On

Ø,OFF:Off

■ Suffix code

None

■ Initial setting

OFF

■ Example

AMB△ON

AMBPL

AMBPL

Normalize(A - B + DL \rightarrow A)

■ Function

Performs normalization (Trace-A - Trace-B + Display line level -> Trace-A).

Header	Program command	Query	Response
AMBPL	AMBPL\(\triangle\)sw	AMBPL?	sw

■ Value of sw

1,ON:On

■ Suffix code

Ø,OFF:Off

■ Initial setting

None OFF

■ Example

 $\mathtt{AMBPL} \triangle \mathtt{ON}$

AMD

AMD Trace A Storage Mode

■ Function

Selects the mode for processing the trace A waveform.

Header	Program command	Query	Response
AMD	AMD∆n	AMD	AMD∆n

■ Value of n

Ø:

NORMAL

1:

MAXHOLD

2:

AVERAGE MINHOLD

CUMULATIVE

4: 5:

OVERWRITE

■ Suffix code

■ Initial setting

None

Ø:

NORMAL

■ Example

AMDƯ

APB

APB

 $A + B \rightarrow A$

■ Function

Adds Trace-A and Trace-B waveform data, and stores the result in Trace-B.

Header	Program command	Query	Response
APB	APB		

■ Example

APB

ARB

ARB

Resolution Bandwidth

■ Function

Switches the mode for setting the resolution bandwidth to AUTO or MANUAL

Header	Program command	Query	Response
ARB	ARB△sw	ARB?	ARB∆sw

■ Value of sw

Ø: MANUAL

1: AUTO

■ Suffix code

None

■ Initial setting

1: AUTO

■ Example

ARBƯ

ARB∆1

AST

AST

Sweep Time

■ Function

Switches the mode for setting the frequency sweep time to AUTO or MANUAL.

Header	Program command	Query	Response
AST	AST∆sw	AST?	AST∆sw
		·	

■ Value of sw

Ø: MANUAL

1: AUTO

■ Suffix code

None

■ Initial setting■ Example

1: AUTO

ple ASTƯ

AST∆1

ASWT

ASWT

Auto Sweep Time

■ Function

Sets the AUTO SWEEP TIME

Header	Program command		Query		Response
ASWT	ASWT∆sw	sw=FAST, SLOW	ASWT?	sw	sw=FAST, SLOW

■ Value of sw

FAST:

FAST

SLOW:

NORMAL

■ Suffix code

None

Initial setting

SLOW (provided te adress already allocated is not initialized)

■ Example

ASWT△**FAST**

ASWT\(\triangle\)SLOW

AT

AT

RF Attenuator

■ Function

Sets the RF attenuator.

Header	Program command	Query	Response
ΑT	AT∆a	AT?	n .
	AT∆n		

■ Value of a

AUTO:

AUTO

UP: DN:

UP

DOWN

Value of n

 $(1 \varnothing step): 0 to 70 dB(10 dB step)$ Ø to 7Ø

■ Suffix code

None: dΒ dB

■ Initial setting

ATT=Calculated value when AUTO is selected for ATT

■ Example

AT∆1Ø

AT∆5Ø

ATB

ATB

Trace-A → Trace-B

■ Function

Copies the waveform data of Trace-A onto Trace-B.

Header		Program command	Query	Response
ATB	ATB			

■ Example

ATB

ATT

ATT

RF Attenuator

■ Function

Sets the RF attenuator.

Header	Program command	Query	Response
ATT	ATT∆n	ATT?	ATT∆n

■ Value of n

Ø:

0dB

12:

60dB

1:

10dB

13:

70dB

2: 3: 20dB

30dB

40dB 50dB

4: 5:

None

■ Suffix code ■ Initial setting

Calculated value when AUTO is selected for ATT

■ Example

 $ATT \triangle 1$

ATUN

ATUN Auto Tune

■ Function Detects the maximum peak point in the specified frequency band of the BG (background) band, and displays its spectrum in the center of the screen in CENTER-SPAN mode.

Header	Program command	Query	Response
ATUN	ATUN		

■ Example ATUN

AUNITS

AUNITS Unit for Log Scale

■ Function Sets the display units when the LOG scale is selected.

Header	Program command	Query	Response
AUNITS	AUNITS∆a	AUNITS?	a
			·

■ Value of a

DBM :

dBm

DBUV:

dBuV

DBMV:

dBmV

DBUVE: V:

dBmV(emf)

W:

: V : W

■ Suffix code

None

■ Initial setting

DBM:

dBm (provided the address already allocated is not initialized)

■ Example

AUNITS_DBM

 $AUNITS \triangle V$

AUTO

AUTO

Coupled Function All Auto

■ Function

Executes all coupled functions (RBW, VBW, SWT, and ATT) in AUTO mode.

Header	Program command	Query	Response
OTUA	AUTO		
	,		,

■ Example

AUTO

AVB

AVB

Video Bandwidth

■ Function

Switches the mode for setting the video bandwidth to AUTO or MANUAL.

Header	Program command	Query	Response
AVB	AVB∆n	AVB?	AVB∆n
			·

■ Value of n

Ø:

MANUAL

1: 2:

AUTO OFF

AUTO

■ Suffix code

None

■ Initial setting

1:

Example

AVBƯ

AVB△1

AVGPAUSE

Average Sweep Mode AVGPAUSE

Specifies the processing (pause or continue) executed after the specified average ■ Function sweeps.

Header	Program command	Query	Response	
AVGPAUSE	AVGPAUSE△sw	AVGPAUSE?	sw	sw=0,1

■ Value of sw

Ø,OFF:

Continue

1,ON:

Pause

■ Suffix code

None

■ Initial setting

ON:

Pause

■ Example

AVGPAUSE△ON

AVR

Number of Trace Average

■ Function

Sets the averaging rate (number of sweep repetitions).

Header	Program command	Query	Response
AVR	AVR∆n	AVR?	AVR∆n
'			

■ Value of n

Ø:

4times

1:

8times

2: 3: 16times 32times

8times

4:

128times

■ Suffix code

None

■ Initial setting

1:

■ Example

AVRƯ

AVR∆3

AWR

AWR

Trace A Write Switch

■ Function

Controls writing of the waveform data to trace A.

Header	Program command		Query	Respoi	nse
AWR	AWR∧sw	SW=ON,1,OFF,0	AWR?	AWR∆sw	sw=ON,OFF

■ Value of sw

1,ON:

TRACE A WRITE ON (same function as CLRW△TRA) TRACE A WRITE OFF (same function as VIEW △TRA)

■ Suffix code

Ø,OFF:

None

1:

TRACE A WRITE ON

■ Initial setting ■ Example

 $AWR \triangle 0$

AXB

AXB

Exchange Trace-A and Trace-B

■ Function

Exchanges the waveform data of Trace-A and Trace-B.

Header		Program command	Query	Response
AXB	AXB	,	<u> </u>	

■ Example

AXB

B1

B1 Trace B Write ON

■ Function

Clears the trace B waveform data to set the write mode to ON (same function as $BWR\triangle 1$, $CLRW\triangle TRB$).

Header	Program command	Query	Response
B1	B1		

■ Example B1

B2

B2 Trace B Max Hold

■ Function

Allows the trace B waveform to be processed in MAX HOLD mode (same function as $BMD\triangle 1$).

Header	Program command	Query	Response
B2	B2		

■ Example

В2

BAUD

BAUD

Baud rate

■ Function

Changes the baud rate of the RS232C.

Header	Program command	Query	Response
BAUD	BAUD∆n	BAUD?	n
		·	

■ Value of n

12ØØ:1200 BPS

24ØØ:2400 BPS 48ØØ:4800 BPS

96ØØ:9600 BPS

■ Suffix code

None

■ Initial setting

2400:2400 BPS

■ Example

BAUD∆9600

BGWR

BGWR

Trace BG Write Switch

■ Function

Controls writing of the waveform data to trace BG.

Header	Program command	Query	Response
BGWR	BGWR△sw	BGWR?	BGWR△sw sw=ON,OFF
	·		

■ Value of sw

1,ON:

TRACE BG WRITE ON (same function as CLRW△TRBG)

Ø,OFF:

TRACE BG WRITE OFF (same function as VIEW△TRBG)

■ Suffix code

■ Initial setting

None

ON:

TRACE BG WRITE ON

■ Example

BGWR△ON

BIN

BIN

ASCII / Binary Data Out

■ Function

Sets the format of output trace data to ASCII or BINARY.

Header	Program command	Query	Response
BIN BIN∆sw			

■ Value of sw

Ø,OFF:

ASCII

BINARY

■ Suffix code

1,ON: None

■ Initial setting

Ø:

ASCII

■ Example

BINƯ BINAON

BMD

BMD

Trace B Storage Mode

■ Function

Selects the mode for processing the trace B waveform.

Header	Program command	Query	Response	
BMD	BMD△n	BMD?	BMD△n	

■ Value of n

Ø:

NORMAL

1:

MAX HOLD

AVERAGE

3:

MIN HOLD

4: 5: **CUMULATIVE OVER WRITE**

■ Suffix code

■ Initial setting

None Ø:

NORMAL

■ Example

 $\texttt{BMD} \triangle \emptyset$

BND

BND

Band Select

■ Function

Sets the band.

Header	Pro	ogram command	Query	Resp	onse
ви́р	BND△n		BND?	BND△n	
■ Value	of n	Ø: BAND AUTO= 1: BAND 0= 2: BAND 1 ⁻ = 3: BAND 1 ⁺ = 4: BAND 2 ⁺ = 5: BAND 3 ⁺ = 6: BAND 4 ⁺ =	(MS2665C) 0 to 21.2 GHz 0 to 3.2 GHz 2.92 to 6.5 GHz 6.4 to 8.1 GHz 8.0 to 15.3 GHz 15.2 to 21.2 GHz	(MS2667C) 0 to 30.0 GHz 0 o 3.2 GHz 3.1 to 6.5 GHz 6.4 to 8.1 GHz 8.0 to 15.3 GHz 15.2 to 22.4 GHz 22.3 to 30.0 GHz	(MS2668C) 0 to 40.0 GHz 0 o 3.2 GHz 3.1 to 5.6 GHz 5.4 to 8.1 GHz 7.9 to 14.3 GHz 14.1 to 26.5 GHz 26.2 to 40.0 GHz
■ Suffix ■ Initial ■ Exam	setting	None AUTO: BAND BND△Ø BND∧3	AUTO= 0 Hz to 2	21.2 GHz/30.0 GHz/	40 GHz

■ Restrictions according to model type and options

If equipment is MS2665C, n=6 can not be selected.

BNDC

BNDC Band Select

■ Function

Sets the band.

Header	Program command		Query		Response

BRIGHT

BRIGHT

Adjust Brightness

■ Function

Selects the LCD display brightness.

Header	Program command	Query	Response
BRIGHT	BRIGHT∆n	BRIGHT?	n

■ Value of n

1 to 4

■ Suffix code

None

■ Example

BRIGHT∆3

BSAUTO

BSAUTO

BW/SWT Auto

■ Function

Allows RBW, VBW, and the sweep time to be set in AUTO mode.

Header	Program command	Query	Response
BSAUTO	BSAUTO		

■ Example

BSAUTO

BTA

BTA

Trace-B→Trace-A

■ Function

Copies the data of the Trace-B waveform to Trace-A.

Header		Program command	Query	Response
BTA	BTA	·		

■ Example

BTA

BWR

BWR

Trace B Write Switch

■ Function

Controls writing of the waveform data to trace B.

Header	Program command	Query	Response	
BWR	BWR∆sw	BWR?	BWR∆sw	sw=ON,OFF
	, 	·		

■ Value of sw

1,ON:

TRACE B WRITE ON (same function as CLRW \triangle TRB) TRACE B WRITE OFF (same function as VIEW \triangle TRG)

■ Suffix code

Ø,OFF: None

Initial settingExample

1:

TRACE B WRITE ON

 $\texttt{BWR} \triangle \emptyset$

C1

C1

A - B Off

■ Function

Turns the A-B function to OFF.

Header	Program command	Query	Response
Cl	Cl		

Example

C1

C2

C2

A - B On

■ Function

Turns the A-B function to ON.

Header	Program command	Query	Response
C2	C2	·	

■ Example

C2

CA

CA RF Attenuator Auto

■ Function

Sets the attenuator to AUTO mode (same function as AAT1, AT△AUTO).

Header	Program command	Query	Response
CA	CA		

CAL

CAL Calibration

■ Function

Performs calibration using the internal CAL signal.

Header	Program command	Query	Response
CAL	CAL∆n		

■ Value of n

Ø:

All

1:

Frequency Level

2: 3:

FM

■ Suffix code

None

■ Example

 $CAL\triangle\emptyset$

CDT

CDT

Set Correction factor on

■ Function

Controls correction of the frequency characteristics.

Header	Program command	Query	Respo	nse
CDT	CDT△sw	CDT?	CDT△sw	SW=0,1

Value of sw

Ø,OFF:

Off On

■ Suffix code

1,ON:

None

■ Initial setting

■ Example

CDTA1

CF

CF

Center Frequency

■ Function

Sets the center frequency (same function as CNF).

Header	Program command	Query	Response
CF	CF△f CF△a	CF?	f=100000000 to 40000000000 Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

-100MHz to 40.0GHz

■ Value of a

UP: CENTER FREOSTEP UP (same function as FUP)

DN: CENTER FREQSTEP DOWN (same function as FDN)

■ Suffix code

f:

None: $Hz(10^{0})$

 $HZ(10^{0})$ HZ:

 $kHz(10^3)$ KHZ,KZ

MHZ, MZ $MHz(10^{6})$

GHz(10^9) GHZ, GZ

None

■ Initial setting

Initial value of f = 10.6 GHz (MS2665C), 15.0 GHz (MS2667C), 20.0 GHz (MS2668C)

■ Example

CF△1235456 CF△5ØMHz

CFAUP

Restrictions according to model type and options

If equipment is MS2665C, upper limit of f is equal to 21.2 GHz

If equipment is MS2667C, upper limit of f is equal to 30.0 GHz

CHPWRFACT

CHPWRFACT Channel Power Correction Factor

■ Function

Sets the Channel power correction factor.

Header	Program command	Query	Response
CHPWRFACT	CHPWRFACT△1	CHPWRFACT?	1

■ Value of I

-99.99dB to 99.99dB

■ Suffix code

None: dB

■ Initial setting

DB, DBM, DM:dB 0dB

■ Example CHPWRFACT△-2.5DB

CLRMENU

Clear menu define **CLRMENU**

■ Function

Initializes the data defined on the menu.

Header	Program command	Query	Response
CLRMENU	CLRMENU		<u></u>

■ Example

CLRMENU

CLRW

CLRW

Clear & Write

■ Function

Clears the trace waveform data to set the write mode to ON.

Header	Program command	Query	Response
CLRW	CLRW△tr	<u>·</u>	

■ Value of tr

TRA:

Trace A (same function as AWR \triangle 1)

TRB:

Trace B (same function as BWR△1)

TRBG:

Trace BG (same function as BGWR△1)

TRTIME:

Trace TIME (same function as TMWR \triangle 1)

■ Example

CLRWATRA

CMK?

CMK?

Current Marker Position

■ Function

Reads the current marker position.

Header	Program command	Query	Response
CMK?		CMK?	СМК∆р
			·

■ Value of p

0 to 500

■ Example

CMK?

CNF

CNF

Center Frequency

■ Function

Sets the center frequency (same function as CF).

Header	Program command	Query	Response
CNF	CNF△f	CNF?	CNFAf f=-100000000 to 4000000000 Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

-100MHz to 40.0 GHz

■ Suffix code

None: $Hz(10^{\circ}0)$

HZ:

HZ(10^0)

KHZ,KZ:

kHz(10³)

MHZ,MZ:

MHz(10^6)

GHZ,GZ:

GHz(10^9)

■ Initial setting

Value of f = 10.6 GHz (MS2665C), 15.0 GHz (MS2667C), 20.0 GHz (MS2668C)

■ Example

 $CNF \triangle 123456$

CNF△50MHZ

CNF?

■ Restrictions according to model type and options

If equipment is MS2665C, upper limit of f is equal to 21.2 GHz If equipment is MS2667C, upper limit of f is equal to 30.0 GHz

CNVLOSS

CNVLOSS EXT Mixer Loss

■ Function

Sets a conversion loss value of the external mixer; a range from 0.00 to 99.99 dB

can be set with an increment of 0.01 dB.

(Setting can be performed on the measurement band currently selected.)

Header	Program co	ommand	Query	Response
CNVLOSS	CNVLOSS△c	c=0.00 to 99.99	CNVLOSS?	C c=0.00 to 99.99 dB

■ Value of c

0.00 to 99.99 dB (0.01 dB step)

■ Suffix code

None: dB

DB:

■ Initial setting

Initial value of c=18.00 dB

■ Example

CNVLOSS△20

dB

■ Restrictions according to model type and options

This command is a MS2667C/68C dedicated command.

COLORDEF

COLORDEF Define user color pattern

■ Function Sets each frame color of user definition patterns.

Header	Program command	Query	Response
COLORDEF	COLORDEF△n,r,g,b	COLORDEF?∆n	r,g,b

■ Value of n

0 to 16: Frame number

■ Value of r,g,b

0 to 63: Strength of the display color of r(red), g(green), and b(blue)

■ Suffix code

None

■ Initial setting

Set value of color pattern 1

■ Example

COLORDEF△1,48,50,63

COLORPTN

COLORPTN Color pattern

■ Function Selects the display color from the display color patterns.

Header	Program command	Query	Response
COLORPTN	COLORPTN∆a	COLORPTN?	a

■ Value of a

COLOR1: Color pattern-1

COLOR2: Color pattern-2 COLOR3: Color pattern-3 COLOR4: Color pattern-4

USERCOLOR: User definition pattern

■ Suffix code

None

■ Initial setting

COLOR1: Color pattern-1

■ Example

COLORPTNAUSERCOLOR

COMMENT

COMMENT Comment display

■ Function

Sets the display method for the comment column.

Header	Program command	Query	Response
COMMENT	COMMENT∆a	COMMENT?	ā

■ Value of a

TITLE:

Displays the title.

TIME:

Displays the time.

OFF:

No comment is displayed.

■ Suffix code

None OFF:

■ Initial setting

No comment is displayed.

Example

COMMENTATITLE

COMP

COMP Composite Mode

■ Function

Switching of the video signal from the Composite Out terminal at the rear panel is carried out by the following key operations.

Header	Program command	Query	Response
COMP	COMP∆a	COMP?	a
•			

■ Value of a

NRM:

Normal

PAL: NTSC: PAL NTSC

■ Suffix code

None

■ Example

COMPAPAL

CONTS

CONTS

Continuous Sweep Mode

■ Function

Sets the sweep mode to continuous mode (same function as \$1).

Header	Program command	Query	Response
CONTS	CONTS		

■ Example

CONTS

COPYCOLOR

COPYCOLOR Copy into user pattern from Color pattern

■ Function

Selects the display color pattern, and copies it to the user definition pattern.

Header	Program command	Query	Response
COPYCOLOR	COPYCOLOR△a		
	·		

■ Value of a

COLOR1:

Color pattern-1

COLOR2: COLOR3:

Color pattern-2 Color pattern-3

COLOR4:

Color pattern-4

■ Suffix code

None

■ Example

COPYCOLOR ACOLOR4

CORC

Correction Factor Initialization CORC

■ Function

Initializes the correction factor currently selected by the CORR command.

Header	Program command	Query	Response
CORC	CORC		

■ Example

CORC

All frequency data and level data are initialized. The initialized data is used as the 0 dB correction values in each frequency range.

CORD

CORD **Correction Factor Entry**

■ Function

Registers the correction factor currently selected by the CORR command.

If the correction factor is set to OFF, it is not valid.

Header	Program command	Query	Response
CORD	CORD\(\triangle n \), f, l \(n=0\) to 149 f=0 to 400GHz \(l=-100.00\) to +100.00dB (incremented in 0.01\) dB steps)	CORD?∆n	CORD \triangle f, l f = 0 to 400 000 000 000 (no units) l=-100.00 to +100.00 dB (incremented in 0.01 steps)

■ Value of n ■ Value of f

0 to 149

1:

0 to 400GHz

I Value of ℚ

-100.00 to +100.00 dB (incremented in 0.01 dB steps)

Suffix code

GHz(10^9) GHZ,GZ:

None: DB:

dΒ dB

■ Example

CORD△Ø, 1MHZ, 1Ø

CORD△1,2ØØØØØ,1Ø

If fn -1 < fn < fn + 1 is not satisfied when n-1 < n < n+1, an error occurs.

CORR

CORR Correction Factor Select

■ Function Selects the type of correction factor.

Header	Program command	Query	Response
CORR	CORR△n	CORR?	CORR∆n
	·		

■ Value of n Ø,OFF: OFF

1: CORR1 2: CORR2 3: CORR3 4: CORR4 5: CORR5

■ Suffix code

None

■ Initial setting

Ø: OFF (the correction factor already registered is not initialized)

■ Example CORR△Ø

CORR△2 CORR△4

CORRLABEL

CORRLABEL Correction Factor Label

■ Function Registers the name of the correction factor currently selected by the CORR command.

Header	Program command	Query	Response
CORRLABE	CORRLABEL∆n,text	CORRLABEL?△n	"text"

■ Value of n

1 to 5

■ Value of text

String of up to 30 characters enclosed by single or double quotes.

■ Suffix code

None

■ Example

CORRLABEL△1, "CORRECTION FACTOR"

CORRLABEL \(2 \, 'MS2665C' \)

CORRLOAD

CORRLOAD Load Correction data

■ Function Reads the correction data from the memory card file.

Header	Program command	Query	Response
CORRLOAD	CORRLOAD△n		

■ Value of n

1 to 99

■ Suffix code

None .

■ Example

CORRLOAD△1

CORRSAVE

CORRSAVE Save Correction data

■ Function

Saves the internal correction data to the memory card.

Header	Program command	Query	Response
CORRSAVE	CORRSAVE△n		

■ Value of n

1 to 99

■ Suffix code

None

■ Example

CORRSAVE△1

COUPLE

COUPLE

Coupling Mode

■ Function

Switches the coupling to AC or DC to monitor an FM waveform.

Header	Program command	Query	Response
COUPLE	COUPLE∆a	COUPLE?	a .

■ Value of a

AC:

AC COUPLING

■ Suffix code

DC:

DC COUPLING

■ Initial setting

None AC:

AC COUPLING

■ Example

COUPLE AC COUPLE△DC

CR

CR

Resolution Bandwidth Auto

Function

Sets the resolution bandwidth selection to the AUTO mode

(same function as ARBV \triangle 1, RB \triangle AUTO).

Header		Program command	Query	Response
CR	CR			· · · · · · · · · · · · · · · · · · ·

■ Example

CR

CRS

CRS

Count Resolution

■ Function

Selects the resolution of the frequency counter.

Header	Program command	Query	Response
CRS	CRS∆n	CRS?	CRS△n

■ Value of n

Ø:

1Hz

1: 2: 10Hz

3:

100Hz 1kHz

■ Suffix code ■ Initial setting None

3:

1kHz

■ Example

 $CRS \triangle 0$

CRS△3

CT

Sweep Time Auto

■ Function

Sets the frequency sweep time to AUTO mode

(same function as AST \triangle 1, ST \triangle AUTO).

Header	Program command	Query	Response
CT	CT .		
		1	

Example

CT

CV

CV

Video Bandwidth Auto

■ Function

Sets the video bandwidth to AUTO mode (same function as $AVB\triangle 1$, $VB\triangle AUTO$).

Header	Program command	Query	Response
CV	CV	·	

■ Example

CV

DATB

Data bit **DATB**

Specifies the data length of the RS232C. ■ Function

Header	Program command	Query	Response
DATB	DATB△n	DATB?	n ·

■ Value of n

7:

7 bit 8 bit

■ Suffix code

8: None

■ Initial setting

8:

8 bit

■ Example

DATB△7

DATE

DATE

Date

■ Function

Sets the built-in clock of the spectrum analyzer to the specified date.

Header	Program command	Query	Response
DATE	DATE∆yyyy,mm,dd	DATE?	yyyy,mm,dd

■ Value of yyyy■ Value of mm

1960 to 2059 (year) 01 to 12 (month)

Value of dd

01 to 31 (day)

■ Suffix code

DIM

DIM

Dimensional common variable

■ Function

Declares array common variable for PTA.

Header	Program command	Query	Response
DIM	DIM△a,n[,m]	·	·

■ Value of a

Array common variable name(integer/real-number numerical variable name,

alpha-numerical characters of less than 7 characters)

■ Value of n

1 to 1024: One-dimensional array size

■ Value of m

1 to 1024: Two-dimensional array size, omittable

suffix code

None

■ Example

DIM△ABC,10,0 --- Declares DIM @ABC(10).

DIM△DEF%,20 --- Declares DIM @DEF%(20).

 $DIM\triangle GHI,5,5\quad --- \ Declares \ DIM \ @GHI(5,5).$

DISPLAY

LCD Display On/Off **DISPLAY**

■ Function

Specifies whether the LCD display is on or off.

Header	Program command	Query	Response
DISPLAY	DISPLAY△sw		
	i		

■ Value of sw

OFF:

LCD display is off. LCD display is on.

ON:

■ Suffix code ■ Initial setting

None

ON:

LCD display is on.

■ Example

DISPLAYAOFF .

DL

DL

Display line, Display-line Level

■ Function

Turns the display line on or off, and sets its level.

Header	Program command	Query	Response
DL	DL\triangles w DL\triangles l	DL?	OFF l: A vailable for the current scale unit, provided that μV units are selected for V, and W units are selected for W.

■ Value of sw

ON:

ON

■ Value of Q

OFF: OFF Value equivalent to full scale of current Y-axis.

For LOG scale: RLV-100 to RLV

For LIN scale: 0 to RLV. For A-B: -100.00 to 100.00 dB

For FM monitor at Trace-time: -Max range to +Max range

■ Suffix code

None:

Available for the current scale unit, provided V units are always

selected in LIN mode.

DB, DBM, DM: dBm DBMV: dBmV

DBUV: $dB\mu V$

 $\begin{array}{ll} \text{DBUVE:} & dB\mu V \text{ (emf)} \\ \text{V:} & V \end{array}$

PW: pW FW: fW

■ Initial setting

-60.00 dBm(Level equivalent to center point of the scale)

■ Example

DLAOFF

DLA-1Ø.ØDBM

DLT

Time Delay DLT

■ Function

Sets the delay time.

Header	Program command	Query	Response
DLT	DLT∆t	DLT?	DLTAt

■ Value of t

-1000s to 65.5ms

■ Suffix code

US:

 μs ms

MS: S: Ø:

■ Initial setting

S

■ Example

DLTA-20MS

DOWNLOAD

DOWNLOAD Download PTA-library name

■ Function

Starts the registration of the PTA library.

Header	Program command	Query	Response
DOWNLOAD	DOWNLOAD△a		

■ Value of a

PTA-library name of less than 8 characters

■ Suffix code

None

■ Example

DOWNLOAD SAMPLE 1

DSPLV

Marker Level Absolute; Relative **DSPLV**

Specifies the marker level in the absolute value display or in the relative value ■ Function

display when seen from the display line.

Header	Program command	Query	Response
DSPLV	DSPLV∆a	DSPLV?	a

■ Value of a

ABS:

Absolute value

REL:

Relative value

■ Suffix code

None

■ Initial setting

ABS:

Absolute value

■ Example

DSPLVAREL

DSPLVM

DSPLVM

Marker Level Absolute/Relative

■ Function

With the trace mode specified, also specifies the marker level in the absolute value display or in the relative value display when seen from the display line.

Header	Program command	Query	Response
DSPLVM	DSPLVM∆tr,a	DSPLVM?∆tr	a

■ Value of tr

TRA:

■ Initial setting

ABS:

Absolute value

■ Example

DSPLVMATRA, REL

DVAR

DVAR

Write value to dimensional common variable

■ Function

Write a value at array common variable for PTA.

Header	Program command	Query	Response
DVAR	DVAR△a,n,m,d	DVAR?△a,n,m	d

■ Value of a

Array common variable name(integer/real-number numerical variable name,

alpha-numerical characters of less than 7 characters)

■ Value of n

1 to 1024: One-dimensional array size

■ Value of m

−1, 1 to 1024: Two-dimensional array size, omittable

Value to be substituted (integer or real-number)

■ Value of d■ Example

DVAR\(\triangle ABC,5,-1,1.2345 \) --- @ABC(5)=1.2345

DVAR\(\triangle DEF\(\%, 15, -1, 200 \) --- @DEF\(\%(15) = 200 \)

DVAR\(\triangle GHI(2,3)=-54.3\) --- @GHI(2,3)=-54.3

E1

E1

Peak Search

■ Function

Executes the function for peak search (same function as MKS \triangle 0,MKMP).

Header	Program command	Query	Response
E1	E1		·
	·	:	

■ Example

E1

E2

E2

Marker to CF

■ Function

Sets the marker to the center frequency (same function as MKR \triangle 3, MKCF).

Header	Program command	Query	Response
E2	E2		

■ Example

E2

E3

E3

Marker to CF Step Size

■ Function

Sets the marker to the frequency step size (same function as MKR \triangle 5M, MKSS).

Header	Program command	Query	Response
E3	E3		

■ Example

E3

E4

E4

Marker to REF

■ Function

Sets the marker to the reference level (same function as MKR \triangle 4, MKRL).

Header	Program command	Query	Response
E4	E4		
		·	

■ Example

E4

ECYC

ECYC Event Cyclical

■ Function Sets the generation period of event interruption for PTA.

Header	Program command	Query	Response
ECYC	ECYC∆t		

■ Value of t 0 to 3600 (s, 0.1 s resolution)

For 0, event is not generated.

■ Suffix code

None

■ Example

ECYC∆2

EDLY

EDLY Event Cyclical

■ Function

Event Delay for PTA.

Header	Program command	Query	Response
EDLY	EDLY∆t		

■ Value of t

0 to 3600 (s, 0.1 s resolution)

For 0, event is not generated.

■ Suffix code

None

■ Example

EDLY∆3Ø

ENTRY

ENTRY Open entry

■ Function

Specifies the entry (prompt for input).

Header	Program command	Query	Response
ENTRY	ENTRY∆text,n,a	ENTRY?	b

■ Value of text

Input prompt: String of up to 20 characters enclosed by single or double quotes.

HZ-system numeric key + data knob + Step key

■ Value of n

Ø,1 to 16: Input type

0: Deletion of input prompt

1: Hz-system numeric key + data knob + Step key

2: Hz-system numeric key + data knob

3: Hz-system numeric key + Step key

4: Hz-system numeric key

5: sec/V/W-system numeric key + data knob + Step key

6: sec/V/W-system numeric key + data knob 7: sec/V/W-system numeric key + Step key

8: sec/V/W-system numeric key

9: dB-system numeric key + data knob + Step key

10: dB-system numeric key + data knob 11: dB-system numeric key + Step key

12: dB-system numeric key

13: No-unit-system numeric key + data knob + Step key

14: No-unit-system numeric key + data knob15: No-unit-system numeric key + Step key

16: No-unit-system numeric key

Hz-system numeric key: Valid for Hz/kHz/MHz/GHz keys

sec/V/W-system numeric key: Valid for μs/ms/s, μV/mV/V, and μW/mW/W keys

dB-system numeric key: Valid for Enter/dB keys No-unit-system numeric key: Valid for Enter key

■ Value of a ■ Value of b Display of current value

Input data (value of each input type)

Numeric input: Converted numeric data according to unit key

Input type 1 to 4: 1 Hz unit

5 to 8: 1 ns / 1 nV / 1 nW unit 9 to 12: 0.01 dBm / 0.01 dB Unit

13 to 16: input data as it is

ERASEWUP

ERASEWUP Erase warm up message

■ Function

Erases the message of warm up.

Header	Program command	Query	Response
ERASEWUP	ERASEWUP		

Exa	m	ρl	e

ERASEWUP

ERROR?

ERROR?

Read out error code

■ Function

Reads the contents of error codes, for example, details of an execution error.

Header	Program command	Query	Response
ERROR?		ERROR?	e1,e2

Main code and subcode which indicate the error details. ■ Value of e1,e2

Main code

300 to 399: Syntax error 400 to 499: Communication error

450 to 459: Media error 500: Range error Inhibit error 501:

502: Execution error

503: Setting condition not enough

Hardware error 504:

600: Warning

ESE₂

ESE2 Event Status Enable(END)

■ Function

Allows the END Event Status Enable Register to select which bit in the corresponding Event Register causes a TRUE ESB summary message bit 2 when set.

Header	Program command	Program command Query Re	
ESE2	ESE2∆n	ESE2?	n

■ Value of n

Ø to 255: Represents the sum of the bit-weighted values enabled by the

 $2^{0}=1,2^{1}=2,2^{2}=4,2^{3}=8,2^{4}=16,2^{5}=32,2^{6}=64,2^{7}=128$ corresponding to

bits 0, 1, 2, 3, 4, 5, 6, 7 of the END Event Status Register.

■ Suffix code

None

■ Example

ESE2△1

ESR2?

ESR2? Event Status Regiser(END)

Function

Allows the sum of the binary-weighted event bit values of the END

Event Status Register to be read out by converting them to decimal. After readout,

the END Event Status Register is reset to 0.

Header	Program command	Query	Response
ESR2?		ESR2?	n

■ Value of n

0 to 255

■ Suffix code

None

■ Example

ESR2?

ETIM

ETIM

Event Time

■ Function

Sets the time of event-interruption generation for PTA.

Header	Program command	Query	Response
ETIM	ETIM∆t1,t2,t3		

■ Value of t1 to t3

t1: Hour (0 to 23) t2: Minute(0 to 59)

t2: Minute(0 to 59) t3: Second(0 to 59)

■ Suffix code

None

■ Example

 $ETIM \triangle 10, 15, 30$

EX

EX

Exchange Trace-A and Trace-B

■ Function

Exchanges the trace-A and trace-B wave data.

Header	Program command	Query	Response
EX	EX		

■ Example

EX

EXTTYPE

Ext Trigger Input Type

■ Function

Chooses the level of the external trigger when EXT is selected for the trigger source.

Header	Program command	Query	Response

START-STOP

■ Example

FRQ△Ø

FRQDOMAIN

FRQDOMAIN Frequency Domain Sweep

■ Function

Sets whether to perform frequency lock operation of frequency axis sweep (Trace-A, B) in every sweep.

Header	Program command	Query	Response
FRQDOMAIN	FRQDOMAIN∆a	FRQDOMAIN?	a

■ Value of a

LOCK:

Performs a lock operation in every sweep.

UNLOCK:

Performs a lock operation once in one cycle of a specified number

of sweep. (lock domein sweep)

■ Suffix code

None

Initial setting.

LOCK:

Performs a lock operation in every sweep.

■ Example

 ${\tt FRQDOMAIN}\triangle{\tt UNLOCK}$

FS

FS

Full Span

■ Function

Sets the frequency span to the maximum value settable in the frequency band being set.

Header	Program command	Query	Response
FS	FS		
		!	

■ Example

FS

FSS

FSS

Frequency Step Size

■ Function

Sets the frequency step size for stepping up/down the frequency (same function as SS).

Header	Program command	Query	Response
FSS	FSS∆f	FSS?	FSS△f f=1 to 40000000000 Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

If equipment is MS2665C, upper limit of f is equal to 21.2 GHz.

If equipment is MS2667C, upper limit of f is equal to 30.0 GHz.

FULBAND

FULBAND EXT Mixer Band Select

■ Function

Selects an external mixer's Band. There are eleven. BANDs from 0 to 10. In GP-IB, the selection is made according to BAND NAME.

Header	Program command	Query	Response
FULBAND	FULBAND△a 2=K, A, QJ	FULBAND?	а a=K, A, QJ

■ Value of a

Corresponds to one of K, A, Q, ..., J in LIST OF EXTERNAL MIXER BANDS.

- K BAND K (18.0 to 26.5 GHz, 4+)
- A BAND A (26.5 to 40.0 GHz, 6+)
- Q BAND Q (33.0 to 50.0 GHz, 8+)
- U BAND U (40.0 to 60.0 GHz, 9+)
- V BAND V (50.0 to 75.0 GHz, 11+)
- E BAND E (50.0 to 90.0 GHz, 13+)
- W BAND W (75.0 to 110.0 GHz, 16+)
- F BAND F (90.0 to 140.0 GHz, 21+)
- D BAND D (110.0 to 170.0 GHz, 26+)
- G BAND G (140.0 to 220.0 GHz, 34+)
- J BAND J (220.0 to 325.0 GHz, 53+)
- Suffix code

None

■ Initial setting

Initial setting of a=K

■ Example

FULBAND△Q

FULBAND△J

■ Restrictions according to model type and options

This command is an MS2667C/68C dedicated command.

FUP

FUP Center Frequency Step Up

■ Function

Increases the center frequency by the frequency step size if it has been set

(same function as $CF\triangle UP$).

Header	Program command	Query	Response
FUP	FUP		,
L .			

Example

FUP

8-64

GATE

GATE Gate Sweep ON / OFF

■ Function Sets the gate function to be set to ON or OFF.

Header	Program command	Query	F	Response

MC△OFF

MCL

MCL

Clear Multi Marker

■ Function

Deletes reegistrations of all multi-markers.

Header	Program command	Query	Response
MCL	MCL		

■ Example

MCL

MEAS

MEAS

Measure Function

■ Function

Executes each item of the Measure functions when specified.

Header	Program command	Query	Response
MEAS	MEAS△data1,data2	MEAS?	data1 data1=OFF,FREQ,NOISE,OBW, ADJ,MASK,TEMP,POWER CHPWR,CN

■ Value of data1,data2

Format1:Specifies the measurement item and whether to switch it ON/OFF or execute it.

OFF: Measurement off
FREQ, ON: Frequency count ON
FREQ, OFF: Frequency count OFF
NOISE, ON: Noise calculation ON
NOISE, OFF: Noise calculation OFF

OBW, EXE: Executes the OBW calculation.

ADJ, EXE: Executes the ADJ-CH calculation.

TEMP, CHECK: Executes the template check.

MASK, CHECK: Executes the mask check.

POWER, EXE: Executes the burst power calculation.

Format2: Specifies the measurement item and calculation system. Then, specifies whether to switch it ON/OFF or execute it.

NOISE, ABS: Sets the noise calculation (Absolute method) to ON.

NOISE, CN: Sets the noise calculation (C/N ratio method) to ON.

OBW, XDB: Executes the OBW calculation (X dB down method).

OBW, N: Executes the OBW calculation (N% method).

ADJ, UNMD: Executes the ADJ-CH calculation (R: Ref Level method).

ADJ, MOD: Executes the ADJ-CH calculation (R: Total Power method).

ADJ, INBAND: Executes the ADJ-CH calculation (R: Inband method).

CHPWR, ON: Channel Power calculation ON

CHPWR, OFF: Channel Power calculation OFF

MENU

MENU

Define menu

■ Function

Defines the menu key (for F-key menu).

ogram command Query	Response
text1, text2,	<u> </u>
text1, text2, xt3,n	

■ Value of m

1001 to 1200: Menu No.

■ Value of text 1 to text3

Character string (less than 10 characters) enclosed by single or double quotates:

Menu title 1 to 3

■ Value of n

1001 to 1020: Lower menu set

■ Suffix code

None

■ Example

MENU△1100," Sample *"," Menu ","",1010

MENULOAD

MENULOAD Load Menu define data

■ Function

Reads out the menu define data from external files.

Header	Program command	Query	Response
MENULOAD	MENULOAD \triangle n		·

■ Value of n

1 to 99

■ Suffix code

None

■ Example

MENULOAD△1

MENUSAVE

MENUSAVE Save Menu define data

■ Function Stores the interior menu define data in external files.

Header	Program command	Query	Response
MENUSAVE	MENUESAVE△n		

■ Value of n

1 to 99

■ Suffix code

None

■ Example

MENUSAVE△1

MENUSET

MENUSET

Define menu set

■ Function

Defines the menu set (one menu set).

Header	Program command	Query	Response
MENUSET	MENUSET△m, text, f1, f2, f3, f4, f5, f6, n, p1, p2		
		i	

■ Value of m

1001 to 1020: Menu Set No.

■ Value of text

Character string enclosed by single or double quotates: Menu Set Title None or 1001 to 1200: Menu No. 1 to 6 corresponding to soft keys 1 to 6.

■ Value of f1 to f6

None or 1001 to 1020: Next page Menu Set

■ Value of n
■ Value of p1

1 to 4: Page No.

■ Value of p2

1 to 4: Tago No.

■ Suffix code

None

■ Example

MENUSET△1001, "Sample

Menu", 1101, 1102, 1103, 1104, 1105, 1106, ,1,1

MFM

MFM

FM Monitor

If there is no opt.07 AM/FM demodulator, this command is invalid.

MFR?

MFR?

Multi Marker List Query (Frequency)

■ Function

Reads the frequency data at the multi marker point.

Header	Program command	Query	Response
MFR?		MFR?△n	MFR△f f=-100 to 4000000000
			Transfers the data with no suffix code in units of 1 Hz.

■ Value of n

1 to 10

■ Suffix code

None

MHI

MHI

Highest 10 (Multi Marker)

■ Function

Registers the multi markers at 10 peak points starting from the highest level.

Header	ı ·_	Program command	Query	Response
MHI	MHI	·	<u>- :</u>	· ———

スパエエ	┰-
WIH	- 1
7.77.7	_

MHM

MHM

Harmonics(Multi Marker)

■ Function

Registers the multi markers to the 10th harmonic max. , based on the frequency of

the active marker.

Header	Program command	Query	Response
МНМ	МНМ		

■ Example

MHM

MKA?

MKA?

Marker Level Read

■ Function

Reads out the level data at the marker point. At the delta marker point, the level differences are read out (same function as MKL?).

Header	Program command	Query	Response
MKA?		MKA?	1
			v
	·	•	W
	•	,	f

■ Value of I No unit. Level data in units of 1 dB (when display unit system for marker level is dB).

Resolution is 0.01 dB.

■ Value of v No unit. Level data in units of 1 n V (when display unit system for marker level is V).

Resolution is 0.1 nV.

■ Value of w No unit. Level data in units of $1 \mu W$ (when display unit system for marker level is W).

Resolution is 1 aW.

■ Value of f No unit. Frequency data in units of 1 Hz (for FM MONITOR).

Resolution is 1 Hz.

■ Example MKA?

MKACT

MKACT

Marker Active

■ Function

Selects the active multi markers.

Header	Program command	Query	Response
MKACT	MKACT△n	MKACT?	n
	·	1	

■ Value of n

1 to 10 (Multi marker No.)

■ Suffix code

None

■ Initial setting

■ Example

MKACT△1

MKC

MKC

Frequency Counter

■ Function

Turns ON/OFF the function for measuring the marker frequency during display using the counter (same function as MEAS△FREQ).

Header	Program command	Query	Response
MKC	MKC∆sw	MKC?	MKC∆sw

■ Value of sw

Ø: 1: OFF ON

■ Suffix code

Active Marker Trace

■ Function

Specifies the trace for displaying the marker when the display format is trace A on B.

Header	Program command	Query	Response
MKTRACE	MKTRACE△tr	MKTRACE?	tr

■ Value of tr

TRA:

Trace A

TRB:

Trace B

■ Suffix code

None

■ Initial setting TRA:

Trace A

■ Example

MKTRACE△TRB

MKTRACK

Tracking ON/OFF MKTRACK

■ Function

Sets the signal tracking function to ON/OFF.

Header	Program command	Query		Response
MKTRACK	MKTRACK△sw	MKTRACK?	sw	sw=ON.OFF

■ Value of sw

1,ON:

ON **OFF**

■ Suffix code

Ø,OFF: None

OFF:

OFF

■ Initial setting
■ Example

MKTRACK△ON

MKW

Zone Marker Width

■ Function

Specifies the zone marker width in the div unit.

Header	Program command	Query	Response	
MKW	MKW△n	MKW?	MKW△n	a=0 to 2,5 to 7

■ Value of n

Ø:

0.5div

1:

Spot

2: 5: 10div

6:

1div 2div 5div

1div

7:

■ Suffix code

■ Example

 $MKW \triangle 1$

MKW△5

MKZ

MKZ

Zone Marker Position

■ Function

Specifies the zone marker center position on the X axis in the point unit

(same function as MKP).

Header	Program command	Query	Response
MKZ	MKZ∆p	MKZ?	MKZ∆p

0 to 500

■ Value of p■ Suffix code

None

■ Initial setting

Value of p=250

■ Example

MKZ△25®

MKZ△5ØØ

MKZF

MKZF Zo

Zone Marker Position

■ Function

Specifies the zone marker center position on the X axis in onw od rhw frequency or time units.

Header	Program command	Query	Response
MKZF	MKZF△f	MKZF?	f
	MKZF△t		t
			f=-1000000000 to 0 to 40000000000
			Transfers the data with no suffix code in units of 1 Hz.
			t=-10000000000 to 1000000000
	·		Transfers the data with no suffix code in units of 1 µs.

■ Value of f

-100 MHz to 40.0 GHz (specified when the valid trace is A, B, or BG)

■ Value of t

-1000 s to 1000 s (specified when the valid trace is TIME)

■ Suffix code

f:

 $Hz(10^{0})$

HZ:

None:

Hz(10^0)

KHZ,KZ:

 $kHz(10^3)$

MHZ,MZ:

MHz(10⁶)

MLO

MLO

Multi Marker Off

■ Function

Executes Off to the multi marker function.

Header		Program command	Query	Response
MLO	MLO			
				,

■ Example

MLO

MLR?

MLR? Multi Marker List Query (Level)

■ Function Reads out the level data at the multi marker point.

der	Program command	Query	Response	
R?		MLR?△n	MLR△l	
			V W f	
			v	

■ Value of n 1 to 10

■ Value of I No unit. Level data in units of 1 dB (when display unit system for marker level is dB).

Resolution is 0.01 dB.

■ Value of v No unit. Level data in units of 1 nV (when display unit system for marker level is V).

Resolution is 0.1 nV.

■ Value of w No unit. Level data in units of 1 µW (when display unit system for marker level is W).

Resolution is 1 aW.

■ Value of f No unit. Frequency data in units of 1 Hz (for FM MONITOR).

Resolution is 1 Hz.

MMASK

MMASK Select Mask

■ Function Selects one of masks 1 to 5 used for mask management functions.

Header	Program command	Query	Response
MMASK	MMASK△n	MMASK?	n
		,	

■ Value of n

1 to 5 (mask No.)

■ Suffix code ■ Initial setting None

■ Example

MNOISE

Noise Measure Method MNOISE

■ Function Selects the calculation method for noise measurement.

Header	Program command	Query	Response
MNOISE	MNOISE∆a	MNOISE?	а
-			

■ Value of a

ABS:

Absolute method

CN:

C/N Ratio method

■ Suffix code

None

■ Initial setting

ABS:

Absolute method

■ Example

MNOISE△ABS

MOBW

OBW Measure Method MOBW

■ Function

Selects the calculation method for OBW.

Header	Program command	Query	Response
MOBW	MOBW∆a	MOBW?	a .

■ Value of a

XDB:

XdB Down method

N:

N% method

■ Suffix code

None

■ Initial setting

N:

N% method

■ Example

 $MOBW\triangle N$

MON

MON

Monitor Mode

■ Function

Selects the function for monitoring the sound from the detector output.

Header	Program command	Query	Response
MON	MON∆a	MON?	a

■ Value of a

AM:

Amplitude Modulation

FM:

Frequency Modulation (for broadcasting) Narrow band FM (for communication)

FM NARROW: OFF:

■ Suffix code

None

Initial setting

OFF:

OFF

Example

 $MA\triangle MOM$

■ Restrictions according to model type and options

If there is no opt.07 AM/FM demodulator, this command is invalid.

MONVOL

MONVOL

Monitor Volume

■ Function

Adjusts the volume of the sound monitor.

Header	Program command	Query	Response
MONVOL	MONVOL△n	MONVOL?	n

■ Value of n

0 to 20 (1step)

■ Suffix code

None

■ Initial setting

ST∆2ØMS

■ Restrictions according to model type and options

If there is no opt.04 high-speed time domain, the value of t becomes 20 ms to 1000 s.

STF

STF

Start Frequency

■ Function

Sets the start frequency (same function as FA).

Header	Program command	Query	Response
STF	STF△f	STF?	STFAf
			f=-100000000 to 0 to 40000000000
			Transfers the data with no suffix code in units of 1 Hz.

■ Value of f

-100MHz to 40.0 GHz

■ Suffix code

Hz(10⁰) None:

HZ:

 $Hz(10^{0})$

KHZ, KZ: MHZ, MZ:

 $kHz(10^3)$

GHZ,GZ:

MHz(10⁶) $GHz(10^{9})$

■ Initial setting f=0Hz

■ Example

STF△123MHZ

STF△45.6KHZ

■ Restrictions according to model type and options

If equipment is MS2665C, upper limit of f is equal to 21.2 GHz. If equipment is MS2667C, upper limit of f is equal to 30.0 GHz.

STPB

STPB

Stop bit

■ Function

Specifies the RS232C stop bit.

Header	Program command	Query	Response
STPB	STPB△n	STPB?	STPB△n

■ Value of n

1:

1 bit 2 bit

2:

■ Suffix code

None

■ Initial setting

1:

1 bit

■ Example

STPB A 2

SV

SV

Save Data into Internal Registor

■ Function

Saves trace data/parameter data to the built-in register (same function as RGSV).

Header	Program command	Query	Response
sv	SV∆n		
	, , , , , , , , , , , , , , , , , , ,		·

■ Value of n

1 to 12 (Memory No.) None

■ Suffix code

■ Example

SV∆1

SVBMP

SVBMP

Save BMP format file

■ Function

Saves screen data(dot) at memory card using BMP format.

Header	Program command	Query	Response
SVBMP	SVBMP		
	SVBMP△n		

1 to 999 (File No.) When omitted, number is appended automaticallay.

■ Value of n ■ Suffix code

None

■ Example

SVBMP△1

SVM

SVM

Save Data into Memory Card

■ Function

Saves the measurement conditions (parameters) and measured results (traces) to memory card.

Header	Program command	Query	Response
SVM	SVM△n		

■ Value of n

1 to 99 (File No.)

■ Suffix code

None

■ Example

SVM△17 SVM△2

SWP

SWP

Single Sweep/ Sweep Status

■ Function

Executes single sweep/Responds to sweep status (sweep completed/sweep in progress). When accepted by the spectrum analyzer, the SWP command causes a single sweep

to be executed by setting the sweep mode to 'SINGLE'.

The next command waits without being processed until its single sweep is completed (same function as TS). The SWP? Query command is used to Query the current sweep status (sweep completed/sweep in progress).

Header	Program command	Query	Response
SWP	SWP	SWP?	SWP△sw

■ Value of sw

Ø:

Sweep completed Sweep progress

■ Example

1: SWP

SWP?

SWSTART

■ Function

Restarts the sweep.

Header	Program command	Query	Response
SWSTART	SWSTART		·
	•		

■ Example

SWSTART

SWSTOP

SWSTOP Stop Sweep

■ Function

Stops the sweep.

Header	Program command	Query	Response
SWSTOP	SWSTOP		

■ Example

SWSTOP

SWT

SWT

Sweep Time

■ Function

Sets the frequency sweep time/time span (same function as ST).

Header	Program command	Query	Response
SWT	SWT∆t	SWT?	SWT△t
			t=12.5 to 1000000000
			Transfers the data with no suffix code in units of 1 μ s.

■ Value of t

 $12.5 \,\mu s$ to $1000 \, s$ (20 ms to $1000 \, s$ for frequency domain)

■ Suffix code

None:

ms US: μs

MS:

ms

■ Initial setting

Calculated value when AUTO is selected for SWT

■ Example

SWT△1S

SWT∆2ØMS

■ Restrictions according to model type and options

If there is no opt 04 high-speed time domain, the t becomes 20 ms to 1000 s.

TDLY

Delay Time TDLY

■ Function

Sets the delay time from the point where trace time triggering occurs.

Header	Program command	Query	Response
TDLY	TDLY∆t	TDLY?	t t=-1000000000 to 65500

■ Value of t

-1000s to 65.5ms

■ Suffix code

None:

ms

US:

μs

MS: S:

ms

Initial setting■ Example

0s

TDLY △2ØMS

■ Restrictions according to model type and options

If there is no opt.06 Trigger/gate circuit, this command is invalid.

TEMP

Select Template TEMP

■ Function

Selects one of the function templates.

Header	Program command	Query	Response
TEMP	TEMP△n	TEMP?	n

■ Value of n

1 to 5 (Template No.)

■ Suffix code ■ Initial setting None

■ Example

TEMP△1

TEMPLOAD

TEMPLOAD Load Template data

■ Function

Reads out template data from an external file.

Header	Program command	Query	Response
TEMPLOAD	TEMPLOAD△n		

■ Value of n

1 to 99

■ Suffix code

None

■ Example

TEMPLOAD△1

TEMPMCL

TEMPMCL

Cancel Moving Value

■ Function

Returns a template movement to 0.

Header	Program command	Query	Response
TEMPMCL	TEMPMCL		

■ Example

TEMPMCL

TEMPMSV

Save Moved Template Data **TEMPMSV**

■ Function

Stores the moved template data in the original template area.

Header	Program command	Query	Response
TEMPMSV	TEMPMSV		
	·		

■ Example

TEMPMSV

TEMPMVX

Template Move X TEMPMVX

■ Function

Moves the template line along the X axis.

Header	Program command	Query	Response
TEMPMVX	TEMPMVX△t	TEMPMVX?	t
	t=-1000 to 1000s		

■ Value of t

-1000 to 1000s

TEMPMVX△1ØMS

TEMPMVY

TEMPMVY Template Move Y

■ Function Moves the template line along the Y axis.

Header	Program command	Query	Response
TEMPMVY	TEMPMVY△1	TEMPMVY?	1

■ Value of I

-200.00dB to 200.00dB

■ Suffix code

None: dB

 $\mathtt{DB},\mathtt{DBM},\mathtt{DM}:\mathtt{dB}$

■ Initial setting

0dB

■ Example

TEMPMVY△-2.5dB

TEMPSAVE

TEMPSAVE Save Template data

■ Function

Moves the internal template data to an external file.

Header	Program command	Query	Response
TEMPSAVE	TEMPSAVE△n		

■ Value of n

1 to 99

■ Suffix code

None

■ Example

 $\texttt{TEMPSAVE} \triangle \, \mathbf{1}$

TEMPSLCT

TEMPSLCT Template Limit Line Select

■ Function

Selects the Limit Line used for evaluating the measured results using the template functions.

Header	Program command	Query	Response	
TEMPSLCT	TEMPSLCT△a,sw	TEMPSLCT?△a	SW sw=ON,OF	F

■ Value of a

■ Example

TEMPSLCT \UP1, ON

TEN

TEN Title Entry

■ Function

Registers the title character string.

Header	Program command	Query	Response
TEN	TEN∆x,y,text		
	4		·

■ Value of x,y

X and Y values at display start point

(Do not use even if specified. Display location is fixed.)

■ Value of text

Character string within 19 characters enclosed by double or single quotes.

■ Suffix code

None

■ Example

TEN△Ø,Ø,"TITLE SAMPLE"

TEXPAND

TEXPAND

Time Expand

■ Function

Turns ON/OFF the trace time-expansion functions.

Header	Program command	Query		Response
TEXPAND	TEXPAND△sw	TEXPAND?	sw	sw=ON,OFF

■ Value of sw

1,ON:

ON OFF

■ Suffix code

Ø,OFF: None

■ Example

 $\texttt{TEXPAND} \triangle \texttt{ON}$

TIME

TIME

Time

■ Function

Sets the time of the built-in clock.

Header	Program command	Query	Response
TIME	TIME△hh,mm,ss	TIME?	hh,mm,ss

■ Value of hh

00 to 23 (Time)

■ Value of mm

00 to 59 (Minute)

■ Value of ss

00 to 59 (Second)

■ Suffix code

None

■ Example

TIME $\triangle \emptyset 8, 3\emptyset, \emptyset \emptyset$

TIMEDSP

Time Display TIMEDSP

■ Function

Sets time display on or off.

Header	Program command	Query	Response
TIMEDSP	TIMEDSP△sw	TIMEDSP?	sw

■ Value of sw

ON:

ON

OFF:

OFF

■ Suffix code

None

OFF:

■ Initial setting

■ Example

TIMEDSP△ON

TITLE

Title Entry

■ Function

Registers the title character string (same function as KSE).

Header	Program command	Query	Response
TITLE	TITLE△text	TITLE?	téxt

■ Value of text■ Example

Character string within 32 characters enclosed by single or double quotes.

TITLE A "MS2665"

TITLE A 'SPECTRUM ANALYZER'

TLV

TLV Trigger Level

■ Function

Sets the threshold level of sweep the start trigger when the trigger source is video

and Ext mode.

Header	Program command	Query	Response
TLV	TLV△1	TLV?	TLV△l

■ Value of @

For EXT:

-10.0 to +10.0 (0.1 VStep)

For video and log:

-100 to 0 (1dBStep)

For video and linear:

0 to 100 (1%Step)

For video and FM:

-100 to 100~(2%Step)

For video (wide):

HIGH,MID,LOW

XMB

XMB Trace B Spectrum Data

■ Function

Writes/reads the spectrum data to/from to trace B (main trace) memory.

Header	Program command	Query	Response
XMB	XMB△p,b	XMB?∆p,d	b1,b2,b3 (ASCII) b1 b2 b3 (BINARY)

■ Value of p

0 to 500(point No.)

■ Value of b

LOG scale: Integer of 0.01 dBm unit (independent of display unit system)

LIN scale: $b = \frac{\text{Voltage value (V)}}{\text{reference level (V)}} \times 10000$

When binary format is specified for response data, data for each point is composed of two bytes. The high-order byte is sent first.

■ Value of d

1 to 501(number of points)

■ Example

 $XMB \triangle 1, -2000$

XMB? $\triangle 1$, 2(reads two-point data items starting from point 1)

XMG

XMG Trace BG Spectrum Data

■ Function

Writes/reads the spectrum data to/from to trace BG memory.

Header	Program command	Query	Response
XMG	XMG△p,b	XMG?∆p,d	b1,b2,b3 (ASCII) b1 b2 b3 (BINARY)

■ Value of p

0 to 500(point No.)

■ Value of b

LOG scale: Integer of 0.01 dBm unit (independent of display unit system)

LIN scale: $b = \frac{\text{Voltage value (V)}}{\text{reference level (V)}} \times 10000$

When binary format is specified for response data, data for each point is composed of two bytes. The high-order byte is sent first.

■ Value of d

1 to 501(number of points)

Example

 $XMG\triangle1,-2000$

XMG? $\triangle 1$, 2(reads two-point data items from point 1)

XMT

XMT

Trace TIME Spectrum Data

■ Function

Write/reads the spectrum data to/from the trace TIME memory.

Header	Program command	Query	Response
XMB	XMT∆p,b	XMT?△p,d	b1,b2,b3 (ASCII) b1 b2 b3 (BINARY)

Value of p

0 to 500(point No.)

■ Value of b

LOG scale: Integer of 0.01 dBm unit (independent of display unit system)

LIN scale: $b = \frac{\text{Voltage value (V)}}{\text{reference level (V)}} \times 10000$

When binary format is specified for response data, data for each point is composed

of two bytes. The high-order byte is sent first.

■ Value of d

1 to 501(number of points)

■ Example

 $XMT \triangle 1, -2000$

XMT? $\triangle 1$, 2(reads two-point data items starting from point 1)

ZEROSPNMODE

ZEROSPNMODE Zero Span Sweep mode

■ Function

Set the mode inside a spectrum analyzer for realizing zero span.

Header	Program command	Query	Response
ZEROSPNMODE	ZEROSPNMODE∆a	ZEROSPNMODE?	a

■ Value of a

DIGITAL: Digital mode

ANALOG: Analog mode

■ Suffix code

None

■ Initial setting

DIGITAL: Digital zero span ZEROSPNMODE △ ANALOG

■ Example■ Supplement

This function is used when you want to use sweep signals, X-out and Z-out also

in a zero span sweep. In this case, set to "ANALOG".

In a normal operation, use "DIGITAL" mode.

*CLS

*CLS

Clear Status Command

■ Function

Clears the status byte register.

Header	Program command	Query	Response
*CLS	*CLS		· .
	-		

Exa	m	ole

*CLS

*ESE

*ESE

Standard Event Status Enable

■ Function

Sets or clears the standard status enable register.

Header	Program command	Query	Response
*ESE	*ESE∆n	*ESE <u>\</u> ?	n

■ Value of n

0 to 255

■ Example

*ESE<u>\</u>2Ø

*ESE?

*ESR?

*ESR? Standard Event Status Register Query

■ Function Returns the current value in the standard event status register.

Header	Program command	Query	Response
*ESR	<u></u>	*ESR?	n

■ Value of n

0 to 255

■ Example

*ESR?

*IDN?

*IDN? Identification Query

■ Function Returns the manufacturer name, model number etc. of the equipment.

Header	Program command	Query	Response
*IDN		*IDN?	ANRITSU,id,ØØØØ,n
			,

■ Value of id

MS2665C (In case of MS2665C)

MS2667C (In case of MS2667C) MS2668C (In case of MS2668C)

■ Value of n

1 to 99(firmware version No.)

■ Example

*IDN?

*OPC

*OPC

Operation Complete Command

■ Function

Sets bit 0 in the standard event status register when all pending selected device operations have been completed.

Header	Program command	Query	Response
*OPC	*OPC		

Example Exa	ple
---	-----

*OPC

*OPC?

*OPC?

Operation Complete Query

■ Function

Sets the output queue to 1 to generate a MAV summary message when all pending selected device operations have been completed.

Header	Program command	Query	Response
*OPC?		*OPC?	1

■ Example

*OPC?

*RST

*RST

Reset Command

■ Function

Resets the device to the third level.

Header	Program command	Query	Response
*RST	*RST		

■ Example

*RST

*SRE

*SRE

Service Request Enable Command

■ Function

Sets the bits in the service request enable register.

Header	Program command	Query	Response
*SRE	*SRE∆n	*SRE?	n
	,		

■ Value of n

0 to 63, 128 to 191(current value of the service request enable register)

■ Example

*SRE

*STB?

*STB?

Read Status Byte Command

■ Function

Returns the current values of the status bytes including the MSS bit.

Header	Program command	Query	Response
*STB		*STB?	n

■ Value of n

Bit	Bit weight	Bit name	Condition of status byte register
7	128		0= Not used
6	64	MSS	0= Service not requested 1=Service requested
5	32	ESB	0=Event status not generated 1= Event status generated
4	16	MAV	0=No data in output queue 1= Data in output queue
3	8	. —	0= Not used
2	4	ESB(END)	0= Event status not generated 1= Event status generated
. 1	2		0= Not used
0	1		0= Not used

■ Example

*STB?

*TRG

*TRG Trigger Command

■ Function

Same function as that of IEEE488 GET-group-execute-trigger bus command. For this command, the MS2665C/67C/68C executes a single sweep (same function as SWP.)

Header	Program command	Query	Response
*TRG	*TRG		
			,

■ Example *TRG

*TST

*TST

Self Test Query

■ Function

Executes an internal self-test and returns the details of any errors.

Header	Program command	Query	Response
*TST		*TST?	n

■ Value of n

Ø:

Self-test completed with no errors.

-32767 to -1,

1 to 327671: Self-test was not completed, or was completed but with errors.

■ Example

*TST?

*WAI

*WAI

Wait-to-Continue Command

Function

Keeps the next command on stand-by while the device is executing a command.

Header	Program command	Query	Response
*WAI	*WAI		
		,	

*WAI

library name

library name Execute PTA Library

■ Function

Executes PTA library.

Header	Program command	Query	Response				
LIBRARY NAME	LIBRARY NAME	<u> </u>					
•							

■ Value of library name

PTA library name (alpha-numeric characters within 8 characters) $VAR \triangle XYZ\%$, 100

SECTION 1 GENERAL

PTA (Personal Test Automation) is the MS2665C/67C/68C spectrum analyzer equipped with a programming language interpreter function to enable programming controls and calculations directly connected with the measurement system with a high-speed language of PTL (Personal Test Language).

In addition to the basic commands similar to BASIC, PTL provides GPIB control commands, file operation commands, screen control commands and function control commands for controlling most functions of the MS2665C/67C/68C.

Programs that can be executed by PTA are two types, including the "PTA program" to be executed by specifying RUN" from the PTA menu, and the "PTA library" to be executed by registering it to the User key menu. Both the PTA program and PTA library are prepared using the universal edit program on an external personal computer, and registered to MS2665C/67C/68C via RS-232C or GPIB. It is also possible to save the edited PTA program/PTA library to a memory card, as a text file, and input it to the memory card interface of MS2665C/67C/68C. Since inputted programs can be stored in the built-in nonvolatile program memory, no efforts otherwise required for reloading after each power-off are necessary.

As for the external interface to PTA, there are GPIB, RS-232C parallel (Centro) and PTA parallel I/O. RS-232C and GIPB connect an external computer to realize PTA to communicate with the computer through a communication memory (dual port memory). PTA is also capable of controlling an automatic inspection system for electronic components or a trimming machine by connecting with such equipment using PTA parallel I/O.

PTA Specifications

The PTA specifications are listed below:

■Display

· Number of displayed characters:

54 characters/line×20 lines (43 characters/line for menu display)

• Displayable characters:

Alphabetic upper-and lower-case characters, numerals, special

symbols, and cursors

• Character font:

6×12 dots (small type)

• Graphics:

Straight line, square, circle and arc

· Screen:

320×240 dots×16 screens

■Input and execution control

• Input :

Front panel, and external computer (by RS-232C, GPIB)

• Execution control:

Front panel, and external computer (by RS-232C, GPIB)

■Memory

• Program memory:

196 kbytes

· Memory card:

256 kbytes, 512 kbytes, 1 Mbyte, 2 Mbytes

■Language Version PTL - V1.6

• Commands :

Edit commands

Program execution commands

File commands

• Statements:

Basic statements

GPIB statements

Event statements

Dual port statements

• Subroutines :

Display subroutines

Filing subroutines
GPIB subroutines
Interface subroutines

Panel subroutines

Waveform memory subroutines

• Functions :

Arithmetic functions
Boolean functions
Statistical functions
Character string functions
System functions

• Variables :

Up to a maximum of 256 user-defined variables (numeric variable, character string variable)

System variables 22 types

• Data types:

Real number:

Significant digits =15 digits Exponential = 10^{308} to 10^{-307}

Integer -32768 to 32767

Character: 256 characters max.

Bit: 8 bits max.

■Interfaces

- RS-232C
- GPIB
- Parallel (centronics)
 (option 10)

PTL Command of PTA

Table 1-1 shows the PTL (Personal Test Language) commands provided with the PTA:

Table 1-1 PTL Command of PTA

ltem	Format	
Edit Commands		
Program input	Line number statement	
Сору	PCOPY new start-line number, [increment], copy-source	
	start-line number, copy-source stop-line number	
Delete	DELETE [start-line number][,[stop line number]]	
	or [line number] [RETURN]	
Renumber	RENUM [new start-line number[,increment[, old start-	
	line number [old stop-line number]]]]	
List output (CRT)	LIST [start-line number] [,[stop-line number]	
List output (printer)	LISTG address [,start-line number] [,[stop-line number]]	
Program size	PMEMO	
Execute commands		
Program execution start	[RUN] menu key or RUN [start-line number] [, suspension-	
	line number]	
Suspension of program	[STOP] menu key	
execution		
Continuation of suspended	[CONT] menu key, CONT [suspension-line number]	
program execution		
Discontinuation of program	[RESET] menu key	
execution		
Direct execution	Statement [RETURN]	
File commands		
Save file	SAVE program name [, start-line number [, stop-line	
	number]]	
Load file	LOAD program name	
Overlay	OVERLAY	
File list display	[PLIST] menu key	
Delete file	PDEL Program name	
Start-up registration	STARTP program name or STARTP @	
Start-up cancel	CANCEL or CANCEL @	

Table 1-1 PTL Command of PTA (Continued)

Item	Format
Statements	
Comments	REM ["comment"] or 'comment
Array declaration	DIM array variable
Assignment	[LET] variable = expression (functions, variables or
	constants)
Jump	GOTO line number or GOTO *label
Jump to subroutines	GOSUB line number or GOSUB *label
Return from subroutines	RETURN
Decision	IF condition statement
Loop beginning	FOR numeric variable = initial value TO ending value STEP
	step value
Loop end	NEXT numeric variable
Key input	INPUT ["display character string",] variable [, variable]
Display	PRINT variable [: format][, variable [: format]][;]
Reverse display	PRINTR variable [: format][, variable [: format]][;]
GPIB input	READ address, input variable [, variable]
GPIB input (1 byte)	BREAD address, input variable [, variable]
GPIB input (2 bytes)	WREAD address, input variable [, variable]
GPIB output	WRITE address, variable [: format][;]
GPIB output (1 byte)	BWRITE address, variable [: format]
GPIB output (2 bytes)	WWRITE address, variable [: format]
Set measurement parameter	PUT string variable (or string)
Read measurement parameter	GET string variable (or string), input variable
(1)	
Read measurement parameter	COM character string variable (or character constant)>
(2)	input variable
Wait	WAIT time (unit is second, minimum 0.01 s.)
Subroutine call	CALL subroutine name
Cursor location	HOME
(home position)	
Cursor location	LOCATE (X, Y)
Erase screen	ERASE
Program end	STOP
Display error	Line NO_SOS_ "Grammer error expression"
Jump on Error	ERROR (error number, line number or * label)
Error main	ERRMAIN
Return to main routine	RETMAIN

External Interfaces of MS2665C/67C/68C

MS2665C/67C/68C provides an RS-232C interface and GPIB interface as standard. In addition, a parallel (centronics) interface (option 10) is optionally available. The usage of these interfaces differs by the setting of the connection port.

RS-232C interface

- When the RS-232C interface is selected as the connection port for the external controller (Connect to Controller):
 - Connect the device that controls the spectrum analyzer, for example, a host computer. Execution of the PTA program/PTA library is indicated and the PTA program can be interfaced via the dual port memory. Also, the PTA program/PTA library is registered.
- When the RS-232C interface is selected as the connection port to the printer/plotter (Connect to Printer/ Plotter):
 - By specifying COPY from the PTA program/library, the printer copies the screen.
- When the RS-232C interface is selected as the connection port to the a peripheral device (Connect to Peripheral):

Serial data transfer is available between the PTA program/library and the external device.

GPIB interface

- When the GPIB interface is selected as the connection port for the external controller (Connect to Controller):
 In this case, the GP-IB interface enters the device port state. Connect the device that controls the spectrum analyzer, for example, a host computer. Execution of the PTA program/PTA library is indicated and the PTA program can be interfaced via the dual port memory. Also, the PTA program/PTA library is registered.
- When the GPIB interface is selected as the connection port to the printer/plotter (Connect to Printer/Plotter): By specifying COPY from the PTA program/library, the printer copies the screen.
- When the GPIB interface is selected as the connection port to the a peripheral device (Connect to Peripheral):
 In this case, the GPIB interface works as a system controller port. It is possible to control external devices from the PTA program/library.

Parallel (centronics) interface

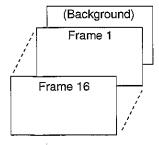

• When the parallel (centronics) interface is selected as the connection port to the printer/plotter (Connect to Printer/Plotter):

By specifying COPY from a PTA program/library, the printer copies the screen.

Screen Configuration of PTA

This section describes the screen specifications of PTA mounted in the MS2665C/67C/68C.

Physical screen configuration

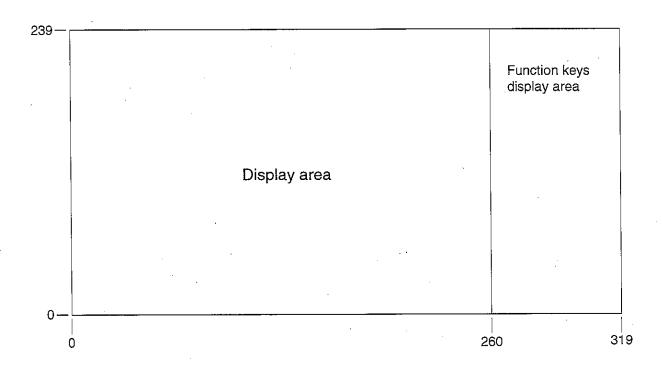

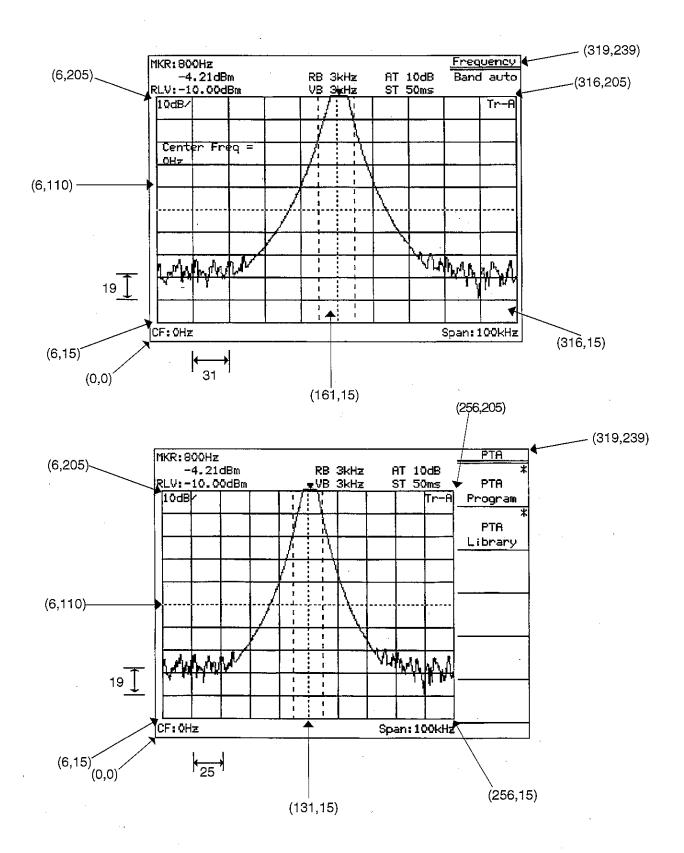

Frame

- 1: Waveform display background
- 2: Scale lines
- 3: Waveform 2
- 4: Waveform 1
- 5: Parameters (title, reference level, RBW, VBW, center frequency, span, etc.)
- 6: Display lines, reference markers
- 7: Triggers, indicators
- 8: Marker zones
- 9: Template/mask standard lines
- 10: Multi-marker Nos.
- 11: (Not used)
- 12: Markers, marker values
- 13: PTA screen
- 14: Menu background
- 15: Menu characters
- 16: Setup and parameter characters, error messages

Note: This frame number is controlled inside the spectrum analyzer. The number is different from the number used by screen subroutines such as CALL CFL.

Display form

SECTION 2 PTA OPERATION

SECTION 2 PTA OPERATION

Outlining the Operation

PTA of MS2665C/67C/68C is capable of executing/operating two types of automation programs, the "PTA program" and "PTA library".

PTA program:

One program can be loaded and executed on the execution memory (RAM) of MS2665C/67C/68C.

A PTA program is loaded and executed on menus following [SHIFT] + [PTA]→[PTA Program: F1].

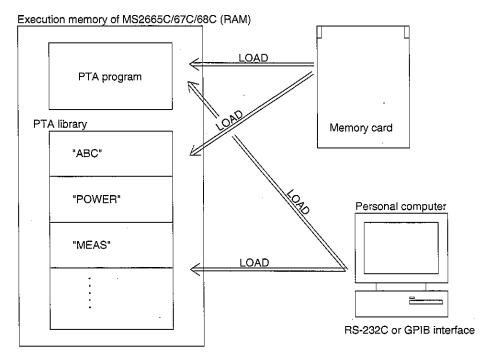

This function is the same as the PTA functions and PTA program execution provided in the existing measuring instruments of our make (for example, MS2601B, MS2602A, MS8604A, etc.).

PTA library:

Multiple programs can be loaded and executed on the execution memory (RAM) of MS2665C/67C/68C.

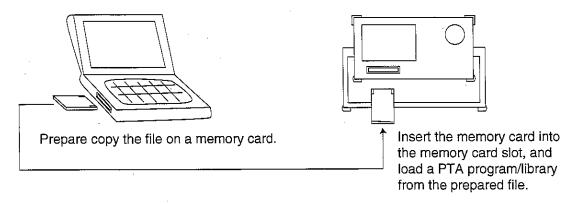

A PTA library is loaded and executed on menus following the [SHIFT] + [PTA] \rightarrow [PTA Library : F2] keys. The PTA library can be executed by registering it to a menu of the [User] key and pressing the appropriate Fkey.

Also, the PTA library can be executed by directly inputting the PTA library name as a remote control command from the controller.

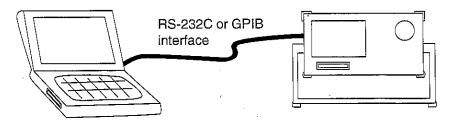

A PTA program or PTA library can be loaded to the execution memory of MS2665C/67C/68C by either of the following three methods:

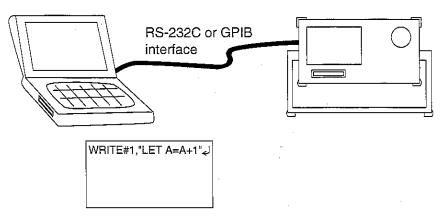

- (1) Prepare a PTA program/library as a text file of in DOS format on a memory card, and load it to spectrum analyzer.
 - Prepare the PTA program/library file using the edit program (editor) on the personal computer.
 - Copy the prepared file to the memory card.
 - Insert the memory card to the memory card slot of spectrum analyzer, and load it from the operation menu of the PTA program or PTA library.

- (2) Prepare a PTA program/library file on the personal computer, and load it to spectrum analyzer via the RS-232C or GPIB interface.
 - Prepare the PTA program/library file using the edit program (editor) on the personal computer.
 - Load the data (PTL statement) of the prepared file to spectrum analyzer via the RS-232C or GPIB interface.

- (3) Remote-controlling spectrum analyzer from the personal computer, directly input the PTL statement.
 - Remote-control spectrum analyzer from the personal computer via the RS-232C or GPIB interface and get the PTA operation screen.
 - Sending a PTA statement line by line to spectrum analyzer, prepare a PTA program/library on the execution memory of spectrum analyzer.

Operations Related to PTA Program

Operations related to the loading and execution of PTA programs are described below. Operations are the same as those of the PTA functions and PTA program execution provided in the existing measuring instruments of our make (for example, MS2601B, MS2602A, MS8604A, etc.).

Startup of PTA

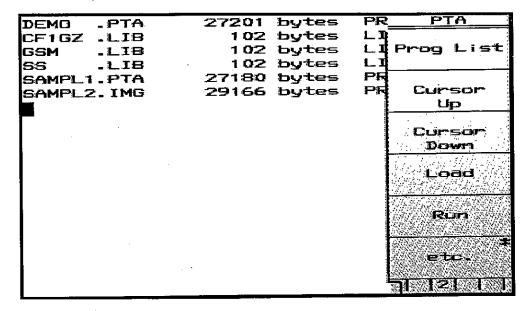

PTA is actuated by pressing the [SHIFT] + [PTA: 7] keys on the front panel or inputting the remote control command "PTA_1". The screen is erased and the cursor appears at the home position (top left of the screen).

Additionally, by registering a PTA program/library as a startup program, it can be actuated and executed upon powering on. (For details about the startup registration of the PTA program, see Section 3 "STARTUP command". Likewise, for details about the PTA library, see Section 3 "POWERUP command".)

Loading the PTA program from memory card

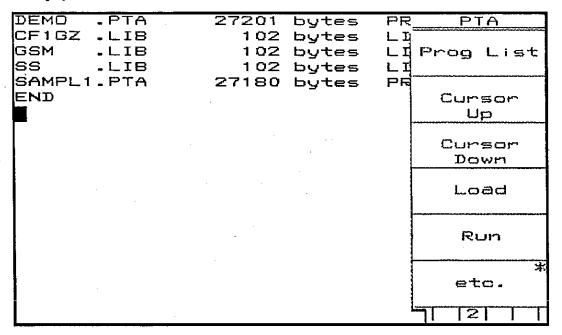

A PTA program can be prepared as a text file in DOS format on a memory card and loaded to spectrum analyzer by the edit program (editor) of the personal computer and the like.

- (1) Press [SHIFT] + [PTA: 7] \rightarrow [PTA Program: F1] keys and get the PTA program operation mode (PTA ON).
- (2) Press the [PLIST: F1] key of the PTA program menu (page 2) to display a list of program names stored in the memory card.

- (3) Press [CURSOR UP: F2] and [CURSOR DOWN: F3] keys and move the cursor to the program name to load.
- (4) Press the [LOAD: F4] key.

 Read out the PTA program from the memory card. When reading is completed, the [END] message is displayed.

- (5) Press the [RUN: F5] key to execute the program.
- (6) To stop execution, press the [RESET: F4] key of the PTA program menu (page 1).

Execution, stop of the PTA program

After loading a PTA program from a memory card, the PTA program can be executed and stopped without loading operation. Since the execution memory of the PTA program is backed up by batteries, it is retained under the loaded condition after powered off. Condition under execution is not retained.

- (1) Press [SHIFT] + [PTA: 7]→[PTA Program: F1] keys and get the PTA program operation mode (PTA ON).
- (2) Press the [RUN: F1] key of the PTA menu (page 1) to execute the program.
- (3) To interrupt program execution, press the [STOP: F2] key.
- (4) To resume program execution, press the [CONT: F3] key.
- (5) To stop program execution, press the [RESET: F4] key. To restart execution, press the [RUN: F1] key.

PTA termination

To terminate PTA, press the [RESET: F4] key to stop program execution, and then press the [PTA OFF: F5] key or input a remote control command "PTA _0".

Afterwards, the screen (which has been displayed by display subroutine) is cleared to be returned to ordinary measurement screen.

Note

For the display subroutine, see Section 5, "System Subroutines".

Format of PTA program file

There are two formats for a PTA program file on a memory card, as follows:

(1) Text format

The extender for a PTA program file in text format is ".PTA". An example of the PTA program file in text format is shown below.

20 '== MS2660 series PTA Program/Library Sample Program 40 ' 50 HOME&ERASE' Erase PTA screen Hello PTA World!!"' Print message 60 PRINT " Preset MS2660 series "IP" 70 PUT "CF 100MHZ"' Set center frequency 100MHz 80 PUT Set frequency span 100kHz 90 PUT "SP 100KHZ"' Perform peak search "MKPK" ' 100 PUT 110 STOP' Stop execution

(2) Execution format

The extender of a PTA program file in execution format is ".IMG". The PTA program file in execution format is stored in the form of binary data and cannot be edited on the personal computer.

The file in execution format can be prepared by adding ".IMG" as the extender to the file name by the LOAD command of PTA. Storing the file in execution format will reduce loading time.

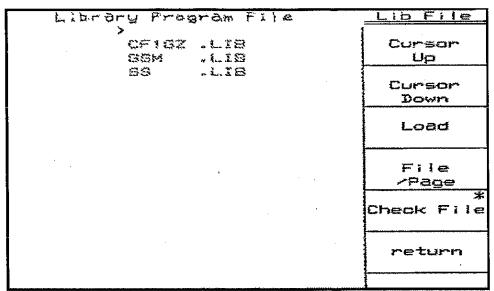

Operations Related to PTA Library

Operations related to the loading and execution of the PTA library are described below.

Loading the PTA library from memory card

A PTA library can be prepared as a text file in DOS format on a memory card and loaded to spectrum analyzer by the edit program (editor) of the personal computer and the like.

- (1) Press [SHIFT] + [PTA: 7] \rightarrow [PTA Library: F2] keys and get the PTA library operation mode (PTA ON).
- (2) Press the [Library File: F2] key of the PTA library menu to display a list of library files stored in the memory card. If the list cannot be displayed at a time, press the [File/Page: F4] key to display the next page.

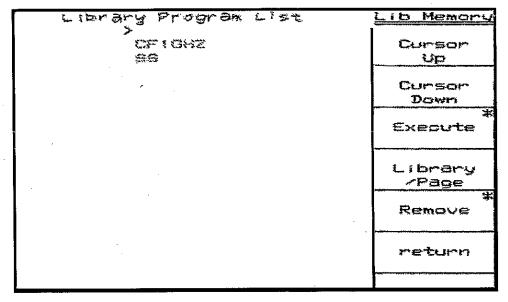

(3) Press [CURSOR UP: F1] and [CURSOR DOWN: F2] keys and move the cursor to the library file name to load.

(4) Press the [LOAD: F3] key.

Read out the PTA library from the memory card. When reading is completed, the [LOADING...END] message is displayed.

SS.LIBOMENT ECADING. 2: END	Lib File
CF1GZ .LIB GSM .LIB	Cursor Up
>ss .LIB	Cursor Down
	Load
	File /Page
	* Check File
	return

After loading, the PTA library loaded on the execution memory can be displayed in list form by pressing the [Library Memory: F1] key of the PTA library menu.

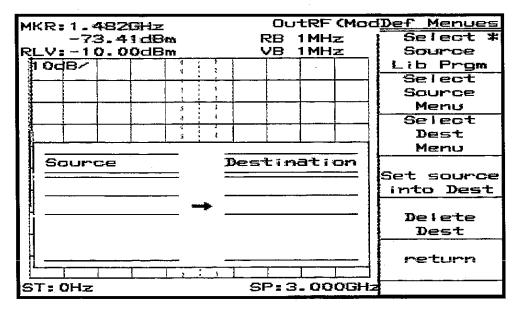

Also test execution can be done by operating menus following the [Executed: F3] key.

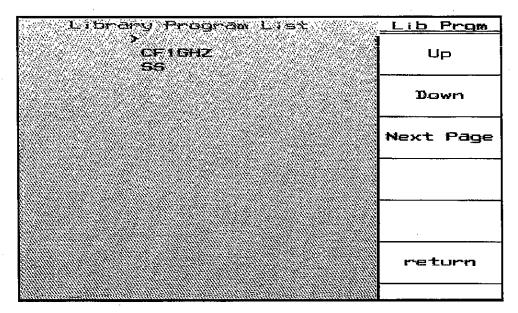

Registering the PTA library to user key

The PTA library loaded to the execution memory can be executed by registering it to a menu of the [User] key on the front panel. The registering operation procedure of the PTA library to the User key described below.

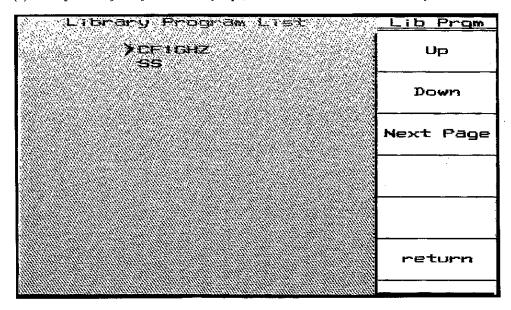

(1) Press [SHIFT] + [User Define : 8] → [Define Menus : F1] keys and display the User key registration screen.

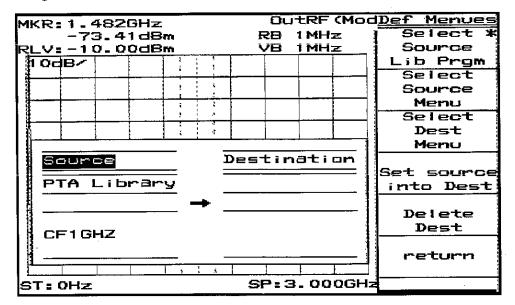

(2) Press the [Select Source Lib prgm: F1] key. The PTA library loaded in the execution memory is displayed in list form.

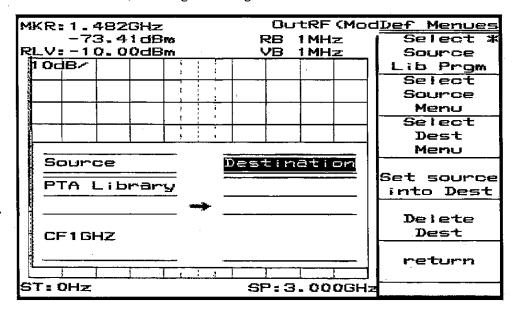

(3) Press [UP: F1] and [DOWN: F2] keys, and move the cursor to the library name to load to the User key.

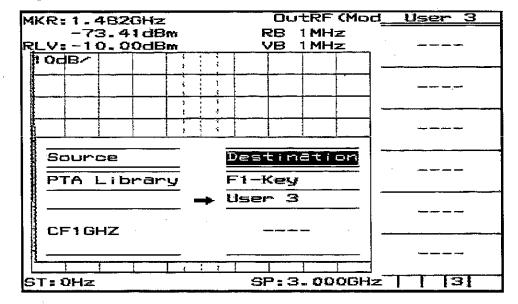

(4) Press the [return: F6] key. The selected library name is displayed in the Source column of the User key registration screen.

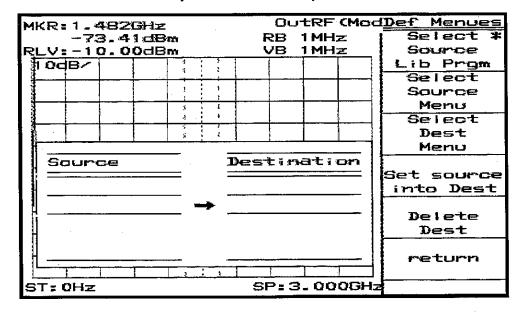

(5) Press the [Select Dest Menu: F3] key. the title in the Destination column of the User key registration screen is inverted, indicating the waiting status for the selection of the destination menu.

(6) Press the [User] key on the front panel and press a menu to register. Each time a menu is pressed, the selected menu is displayed on the Destination column of the User key registration screen. A menu that is pressed last is the destination.

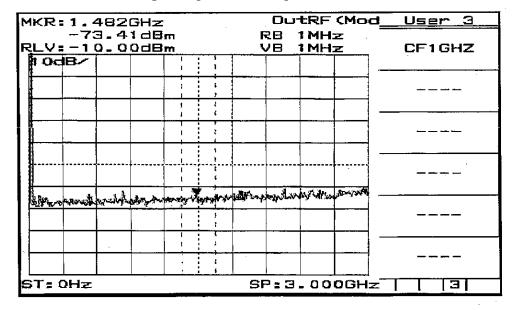

(7) Press [SHIFT] + [User Define : 8] \rightarrow [Define Menus : F1] \rightarrow [Set source into Dest : F4] keys to register the execution of the PTA library to the selected User key.

After registering, pressing the [return: F6] key erases the User key registration screen.

Press the [User] key on the front panel and look at the registered menu; the PTA library name is displayed on the menu, indicating that registration is completed.

Press this key to start executing the registered PTA library.

Execution, stop of the PTA library

The PTA library loaded to the execution memory is normally executed by registering it to the User key, but test execution can be done from the PTA library menu.

- (1) Press [SHIFT] + [PTA: 7] \rightarrow [PTA Library: F2] keys and get the PTA library operation mode.
- (2) Press the [Library Memory: F1] key and display the PTA library loaded on the execution memory in list form. If the list cannot be displayed at a time, press the [File/Page: F4] key to display the next page.
- (3) Press [CURSOR UP: F1] and [CURSOR DOWN: F2] keys and move the cursor to the program name to test-execute.
- (4) Press the [Execute: F3] key and get the PTA library test execution mode.

Under the test execution mode, the following operations are available:

- (5) Press the [RUN: F1] key to execute the library.
- (6) To interrupt library execution, press the [STOP: F2] key.
- (7) To resume library execution, press the [CONT: F3] key.
- (8) To stop library execution, press the [RESET: F4] key. To restart execution, press the [RUN: F1] key.

Format of PTA library file

There are two formats for a PTA library file on a memory card, as follows:

(1) Text format

The extender for a PTA library file in text format is ".LIA". One PTA library file in text format can store one PTA library only. The title of this PTA library is the same as that of the PTA library file. Data in the PTA library file in text form is totally the same as that of the PTA program, with only an exception of the extender of the file.

(2) Execution format

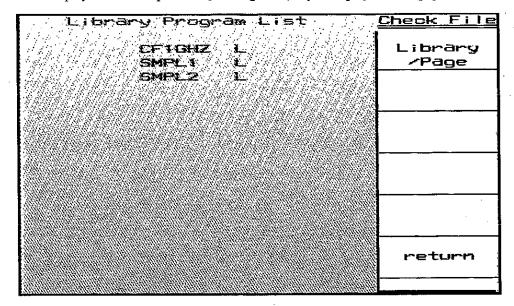

The extender of a PTA library file in execution format is ".LIB". The PTA program file in execution format is stored as binary data and cannot be edited on the personal computer.

One PTA library file in execution format can store plural PTA libraries. There are no title relations between the PTA library file and PTA libraries stored in it.

Operations related to PTA library

In the case of a PTA library file in execution format, stored PTA libraries cannot be confirmed by a file list. For this purpose, the PTA libraries can be listed by the following operations:

- (1) Press [SHIFT] + [PTA: 7] \rightarrow [PTA Library: F2] keys and get the PTA library operation mode.
- (2) Press the [Library File: F2] key of the PTA library menu to display a list of library files stored in the memory card. If the list cannot be displayed at a time, press the [File/Page: F4] key to display the next page.
- (3) Press [CURSOR UP: F1] and [CURSOR DOWN: F2] keys and move the cursor to the library file name to confirm PTA libraries stored in it.
- (4) Press the [Check File: F5] key.
 A list of PTA library files stored in the selected PTA library file is displayed on the screen. If the list cannot be displayed at a time, press the [File/Page: F1] key to display the next page.

Panel Key Operations during PTA Program/Library Execution

The soft keys, numeric keys, and unit keys on the front panel serve as data input keys.

(1) F1, F2, F3, F4 and F5 keys

The F1 to F5 keys are referred to in the program and correspond to the system variables EX1, EX2, EX3, EX4 and EX5 respectively.

Each time the key is pressed, the variable contents are alternately changed to 0 or 1. All the data in these variables are 0 at initial state and resetting. Displayed name in menu can be defined with DEF subroutine.

Note

For EX1, EX2, EX3, EX4 and EX5, see Section 5, "System Variables".

(2) YES and NO keys

These are typing aids for the INPUT statement; the "YES" and "NO" character string can be input by a single key operation.

(3) Numeric keys

These are the [0] to [9],[.] and [BS] keys which are used for inputting data on INPUT statement. Press the [Enter] key to terminate the input; use the [BS] key to delete one character.

(4) Unit keys

Unit key No. 1: Treats this key as the CR key.

Unit key No. 2: Treats this key as the [,] key.

Unit key No. 3: Treats this key as the [-] key.

Unit key No. 4: Invalid

*: The figure below shows unit key numbers.

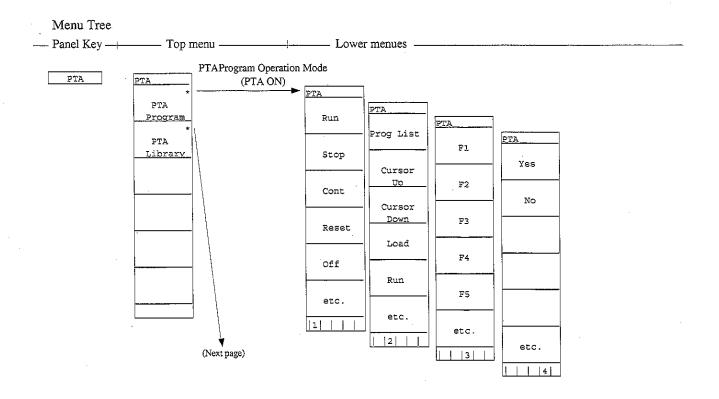

7 8	9	GHz IBm Unit key No. 4 IB
4 5	6 \	MHz V Unit key No. 3
1 2	3 r	kHz mV Unit key No. 2 msec
0 .	+/- Enter ເ	Hz UV Unit key No. 1

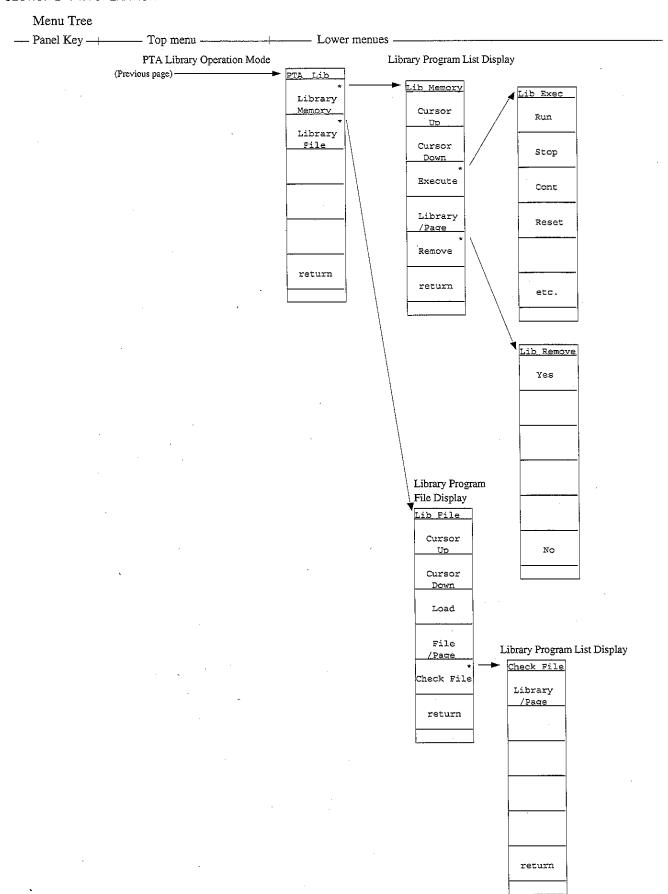

Operation of other panel keys

When PTA is ON, the panel keys are locked-out except for the number/[Enter] keys, [Shift] key, [Local] key and soft keys (F1 to F6).

Menu Construction of the PTA Key

Menu layers following [SHIFT] + [PTA: 7] keys are shown below.

SAVELIB Command	3-27

SECTION 3 PTL COMMANDS

PTL (Personal Test Language) commands include commands for the edition, execution and filing of the PTA programs/libraries, and are composed as shown below:

Program Input Command

(1) Function

When a statement with a line No. is inputted, it is stored as a PTA program/library to the program area. When the line No. is different from those already inputted, the statement is added or inserted, and when the line No. is the same, the statement will replace the already inputted statement.

(2) Format

Line number Statement

Integer constant from 1 to 65535

Notes:

- When 111 or more characters (including the line number) are input on one line during program input, the
 program on that line may not be displayed during LIST-command execution after execution of the RENUM
 command.
- For a description of the RENUM command, see Section 3, "RENUM Command".

PCOPY Command

(1) Function

This statement copies the specified program.

(from <copy-source start-line number> to the <copy-source end-line number>) in the unit of increment specified by <increment> from the <new start-line number>.

If <increment> is omitted, thenÅe10Åfis used as the default value.

(2) Format

1) PCOPY 100, 10, 30 Copies the statement (from lines 10 to 30) to location 100 in increments of 10 and labels all sequent.

2) PCOPY 100,5,10,30 Copies the statement (from lines 10 to 30) to location 100 and in increment of 5 and labels all sequent.

Notes:

- If the line number of a newly-copied statement is identical to the line number of the current statement, ERROR F101 occurs.
- If a line has more than 111 characters when PCOPY is executed, display is disabled during LIST command execution.

DELETE Command

(1) Function

This command deletes all or part of a program.

(2) Format

DELETE [operand 1][,][operand 2]
operand 1≤operand 2

(3) Example

DELETE Deletes entire program and initializes variable values.
 DELETE 100 Deletes statement on line 100.
 DELETE 100, Deletes statements on lines 100 to the end line.
 DELETE 100, Deletes statements on start line to line 500.
 DELETE 100, Deletes statements on line 100 to line 500.

• When deleting only a line, it is possible by Line number [RETURN].

RENUM Command

(1) Function

This command renumbers line numbers used in the program. When the increment value or new line number is omitted, 10 is used as the default value.

(2) Format

	RENUM [[operand 1]	[,][operand 2][,][operand 3][,][operand 4]]
	New-line number	Increment Start-line number End-line number
1)		Described all sections at the section from the line works at the section for the section of the
1)	RENUM .	Renumbers all program statements starting from first-line number 10 in increments of 10
2)	RENUM 100	Renumbers all program statements from new first-line number 100 in increments of 10
3)	RENUM 100,5	Renumbers all program statements starting from new first-line number 100 in increments of 5
4)	RENUM 100,,50	Renumbers statements (from line number 50 through the last line) starting from new first-line number 100, in increments of 10
5)	RENUM 100,5,50	Renumbers statements (from line number 50 through the last line) starting from new first-line number 100, in increments of 5
6)	RENÚM 100,,,150	Renumbers statements (from line number 10 through 150) starting from new first-line number 100 in increments of 10
7)	RENUM 100,,50,150	Renumbers statements (from line number 50 through 150) starting from new first- line number 100 in increments of 10
8)	RENUM 100,5,,150	Renumbers statements (from line number 10 through 150) starting from new first- line number 100 in increments of 5
9)	RENUM 100,5,50,150	Renumbers statements (from line number 50 through 150) starting from new first-line number 100 in increments of 5

Notes:

- Labels can be used for operands 1, 3 and 4.
- "ERROR F101" occurs if there is a line number larger than that of operand 4 when operand 1 is smaller than operand 4.
- If the number of characters on a line is more than 111 characters, when the number of lines of the program line becomes two lines or more with RENUM command, ERROR F20 will occur during LIST command execution and display the lines.

LIST Command

(1) Function

This command displays all or part of a program on the LCD.

(2) Format

LIST [operand 1][,][operand 2]

Start-line number

End-line number

operand 1≤operand 2

1)	LIST		Lists entire program
2)	LIST	100	Lists the statement on line 100
3)	LIST	100,	Lists statements on line 100 to end line
4)	LIST	,5ØØ	Lists statements on start line to line 500
5)	T.T.CT	100 500	Lists statements on line 100 to 500

Note: Labels can be used for operands 1 and 2.

LISTG Command

(1) Function

This command outputs all or part of a program to a printer connected to the RS-232C/GPIB/parallel (centronics) interface.

(2) Format

```
LISTG address [[,][operand 1][,][operand 2]]
```

Address of printer (0 to 30)

Operand 1 and operand 2 in the LISTG command are used in the same way as the LIST command.

Notes:

- To use RS-232C/GPIB/parallel (centronics) interface from PTA, it is necessary to choose a port to use. The selection of the port, press [SHIFT] + [Interface:.] keys, and then press the [Connect to Peripheral: F6] key several times.
- When the program is output to the RS-232C or parallel (centronics) interface, addresses have no meaning, but they should be specified as a formality.

PMEMO Command

(1) Function

This command displays on the screen the used memory size of the program area in which a PTA program/library is stored and the memory size required to store to a memory card.

(2) Format

PMEMO

(3) Output example

Used memory s			bytes
PTA program LIS programs		G	bytes bytes
Variables Unused memory	of the Market Committee of the State of the State of	tanta da Santa da Sa	bytes bytes
File size:			
PTA program	(ASCII)		bytes
	(BINARY)		bytes
LIB programs	(BINARY)	72	bytes

Total size of used memories of program area

Not used

Memory size required to store to memory card

Immediate Execution Command

(1) Function

When a statement with no line number is input and the (RETURN) key is pressed, the statement is immediately executed.

However, GOTO, GOSUB, RETURN, RETMAIN, IF, FOR, NEXT DATA, RDATA, RESTORE and CHAIN, CALLIB statements are not immediate execution commands.

See Section 4 for these statements.

(2)	Form	at
14	1 01111	u

Statement

RUN Command

(1) Function

This command starts PTA program/library execution. Execution is terminated when the STOP statement is executed, when an error occurred, or when the [RESET] key is pressed.

(2) Format

[RUN] key or

RUN [[operand 1][,operand 2]]

Start-line number Suspended-line number

1) RUN

Starts execution from statement on first line

2) RUN 1ØØ

Starts execution from statement on line 100

3) RUN ,500

Starts execution from statement on first line, and suspends execution on line 500

4) RUN 100,500

Starts execution from statement on line 100, and suspends execution on line 500

Note: Contents of variables are not initialized by the RUN command.

STOP Command

(1) Function

This command stops the PTA program/library in execution.

(2) Format

[STOP] key

CONT Command

(1) Function

This command resumes the suspended program execution.

Note that this command can only be executed when program execution is suspended after execution of the RUN or STEP command.

(2) Format

[CONT] key
CONT [operand]

1) CONT

Restarts program from next on suspended line.

2) CONT 1000

Restarts program from next on suspended line, and suspends execution on line 1000.

RESET Command

(1) Function

This command stops command or PTA program/libraries execution.

(2) Format

[RESET] key

(3) Initialization

This Command:

- 1. Clears system variables EX1, EX2, EX3, EX4, and EX5.
- 2. Clears user-defined variables. Common variables are not cleared.

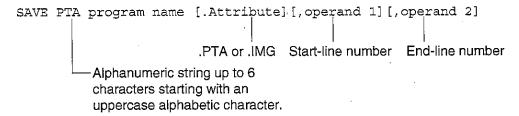

SAVE Command

(1) Function

This command saves a PTA program to a memory card. In this case, the file size of the PTA program must be smaller than the unused memory size of the memory card.

The file size of the PTA program and the unused memory size of the memory card are output on the screen by executing the PMEMO command and the PLIST command, respectively.

(2) Format

Notes:

- The file opened by CALL OPNI (or OPNO) "% file name" is closed when this command is executed.
- Labels can be used as operands 1 and 2.
- Before saving a program, make sure the memory card is formatted. When saving to an unused memory card, format the memory card in advance.
 - For formatting mathod of the memory card, refer to paragraph 4.5.2 of Panel Operation Part in the Operation Manual.
- When .PTA is specified as attribute, the program is saved as an ASCII file. When .IMG is specified, the
 program is saved as a binary file, which has a shorter loading time. As the default attribute, .PTA is
 automatically selected for saving.

LOAD Command

(1) Function

This command loads a PTA program loaded on a memory card and stores it to the program area in the main frame. All the PTA programs already stored in the user program area are replaced by the new program unless OVERLY is executed.

(2) Format

LOAD PTA program name [.Attribute]

Alphanumeric string up to 6 .PTA or .IMG characters starting with an uppercase alphabetic character.

Notes:

- The file (opened by CALL OPNI (or OPNO) "% file name") is closed when this command is executed.
- · When reset during program loading, part of the programs is loaded.
- The spectrum analyzer program area (memory) is backed up by a battery. Therefore, the program contents are not lost even when the power switch is turned off.

OVERLAY Command

(1) Function

This command specifies to overwrite the current PTA program during LOAD command execution.

(2) Format

OVERLAY

Note: This state continues until the RESET command is executed.

PDEL Command

(1) Function

This command deletes the PTA programs stored in a memory card.

(2) Format

PDEL PTA program name or PTA library file name [.Attribute]

T

PTA, IMG, LIB, LIA

Notes:

- "% file name" (data files) cannot be erased by the PDEL command.
- The file (opened by CALL OPNI (or OPNO) "% file name") is closed when this command is executed.
- When attribute is omitted, .PTA is automatically selected as the default attribute for saving.

PLIST Command

(1) Function

This command displays on the CRT screen the names and sizes of files stored on memory card along with the amount of unused memory.

(2) Format

[PLIST] key

(3) Output

This command causes the screen to scroll by page (24 lines) unit.

When more than 17 files are stored on a memory card, the files cannot be displayed on one page, therefore a screen such as 1) below is displayed. The screen is displayed page by page by using the PLIST command repeatedly. When the contents can be displayed on a single page, a screen such as 2) is displayed.

1) When pages follow

	bytes	PROG (IMAGE)
%SDAT0.DAT	1024 bytes	DATA
%SDAT2.DAT	1024 bytes	DATA
ABCXYZ.PTA	15808 bytes	PRJG (ASCII)
		continue

2) When no pages follow

BANDLH.PTA	18568 bytes	PROG (ASCII)
RPLLH.IMG	35786 bytes	PRJG (IMAGE)
MAYMINILIR	27368 hytes	LIRRARY

unused memory size: 89010 bytes

Unused memory size: Indicates unused memory size (No. of bytes) of the memory card.

NOTES

- The file (opened by CALL OPNI (or OPNO) "% file name") is closed when this command is executed.
- Only the PTA program file, PTA library file and data file created by the PTA are displayed by the PLIST command. Therefore, since the spectrum analyzer does not display the saved waveform and measurement parameters, if they exist, the unused memory size is reduced.

STARTP Command

(1) Function

Turns on the PTA and registers the start-up function, which loads and executes the specified PTA program when the power is turned on.

This function can be separately registered and set for a PTA program on a memory card and a PTA program in the main frame.

(2) Format

STARTP program name

: Register for PTA program on memory card

STARTP @

: Register for spectrum analyzer internal PTA program

- 1) Start-up function registration for PTA program on memory card
 - When the power is turned on after this function is registered, the PTA is turned on and the registered PTA
 program is loaded and executed.
 - When this function is registered, a special "p2110. bat" file is created on the memory card. (This file is not displayed by the PLIST command.)
 - In the following cases, the start-up function is not performed even if registered:
 - When a memory card is not inserted when the power is turned on.
 - When a PTA program with the registered program name is not found on the memory card.
 - If the power was turned on while pressing the [PTA: 7] key.
 - This function is executed first even if start-up function is registered for the internal program of the main frame.
 - When start-up function is executed, the PTA program is loaded from the memory card, and the previous program in the main frame is cleared. Also, when start-up function is registered for the internal PTA program, it is cleared too.
 - If both "STARTP" and "STARTP@" are registered, the file registered by the STARTP command is executed preferentially.
- 2) Start-up function registration for spectrum analyzer internal PTA program
 - When the power is turned on after this function is registered, the PTA is turned on and the spectrum analyzer battery back-up PTA program is run automatically.
 - When there is no PTA program in the spectrum analyzer, this function cannot be registered.
 - The start-up function is not performed in the following cases:
 - When the memory card start-up function was executed first.
 - When a new PTA program was loaded after the start-up function was registered. (In this case, start-up function registration is canceled.)
 - When there is no PTA program in the spectrum analyzer.
 - If the power was turned on while pressing the [PTA: 7] key.

CANCEL Command

(1) Function

Cancels start-up function registration.

(2) Format

CANCEL

: Register for PTA program on memory card

CANCEL @ : Cancel registration for spectrum analyzer internal PTA program

- When start-up registration for memory card is canceled, the "p2110. bat" file is deleted.
- When the power is turned on while pressing the [PTA: 7] key, the start-up function is temporarily canceled, but the function registration status does not change.

EDITLIB Command

(1) Function

This command defines a new PTA library, or specifies a PTA library as the object of the program execution and program edition commands.

(2) Format

EDITLIB [PTA library name]

 Alphanumeric string with up to 8 characters starting with a capital alphabet

Characters available for the 2nd character on:

Under bar

Capital alphabet : A to Z

Small alphabet : a to z

Numeral: 0 to 9

However, small alphabets are converted to capitals.

- When the EDITLIB command is executed specifying the name of a new PTA library as a parameter, the
 registration of the specified PTA library is started. The PTA library can be registered by inputting a
 statement with a line No.
- When the EDITLIB command is executed specifying the name of an already registered PTA library as a parameter, a library program to be the object of program execution and edition commands is specified.
- When the EDITLIB command is executed without a parameter, the name of the currently specified library is displayed.
- The PTA library name specified by the EDITLIB command is displayed at the bottom right of the screen.

EDITPTA Command

(1) Function

This command specifies PTA programs as the object of edition and execution.

(2) Format

EDITPTA

Select PTA programs as the object of edition and execution. The object of processing is switched to PTA
programs by executing the EDITPTA command during PTA library selection. Additionally, immediately
after PTA ON, always PTA programs are selected.

RENAME Command

(1) Function

This commands changes the name of the specified PTA library.

(2) Format

Program name to be changed

Alphanumeric string with up to 8 characters starting with a capital alphabet Characters available for the 2nd character on :

Under bar

Capital alphabet : A to Z Small alphabet : a to z

Numeral

: 0 to 9

However, small alphabets are converted to capitals.

• The name of an already registered PTA library is changed. It is not allowed to specify the already registered PTA library name for the new PTA library name.

LIBMEM Command

(1) Function

This command displays a list of PTA libraries in the memory.

(2) Format

LIBMEM

Names of library programs in the memory are displayed in list form. If the list cannot be displayed at a
time, re-execute the LIBMEM command to display the next page. If there is no library in the memory,
nothing is displayed.

SAVELIB Command

(1) Function

This command saves the specified measuring instrument library program to a memory card with the specified file name.

(2) Format

SAVELIB File name [,PTA library name...]

 Alphanumeric string with up to 8 characters starting with a capital alphabet

Characters available for the 2nd character on:

Under bar

Capital alphabet : A to Z

Small alphabet : a to z

Numeral: 0 to 9

However, small alphabets are converted to capitals. Library names can be specified up to ten names by separating them with commas (,). If no name is specified, all the PTA libraries residing in the memory are specified.

Alphanumeric string with up to 6 characters starting with a capital alphabet Characters available for the 2nd character on :

Under bar

Capital alphabet : A to Z

Small alphabet : a to z

Numeral: 0 to 9

However, small alphabets are converted to capitals.

• The PTA library is saved in intermediate code form. The file extender is ".LIB".

SECTION 4 PTL

PTL (Personal Test Language) is a programming language similar to BASIC.

It consists of basic PTL statements and extended PTL (including system variables, system subroutines, and GPIB statements).

Elements of Statement Configuration

Line number

(1) Function

A line number is placed at the beginning of each statement and serves as an index during program editing or execution.

(2) Format

Numeric String

Integer constant from 1 to 65535

Constants

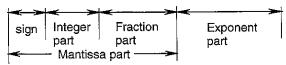

(1) Function

A constant represents a specific numeric value, character string or bit string.

(2) Format

(a) Numeric constants

[-] numeric string [.numeric string] [E[-] numeric string]

The maximum number of mantissa digits is 15(including a sign and a decimal point.) and the range of exponent part is 10^{308} to 10^{-307} .

When a numeric constant is assigned to an integer type numeric variable, the range is -32768 to +32767.

(b) Character constants

"String"

1 to 255 characters enclosed with double quotation marks (" ")

Note: One line of program corresponds two lines on screen. Then, maximum number of characters on a program line is limited to the value.

(c) Bit constants

· Hexadecimal constant

\$ Hexadecimal expression

0 to FF

· Binary constant

Binary expression

0 to 11111111

(3) Examples

(a) Numeric constants

1

-12.3

12E3

...Equal to 12000

-Ø.12E-3

...Equal to -0.00012

(b) Character constant

"Who are you? "

(c) Bit constants

\$F

...Equal to #1111 (binary) or 15 (decimal).

#00011010

...Equal to \$1A (hexadecimal) or 26 (decimal)

Variables

Variables include local, common and system variables. For the system variable, see Section 5, "System Variables".

Local variables

A local variable is one that is effective in a PTA program/library only. Local variables include simple and array variables.

Simple variable

There are numeric, character string, and bit string variables. The simple variable consists of eight or less characters, the first of which must be an upper-case alphanumeric character as shown below:

• Real number-type numeric-variable name:

Upper-case alphabetic character [alphanumeric

[alphanumeric]] —— ABCD0123

Integer-type numeric-variable name:

Upper-case alphabetic character [alphanumeric

[alphanumeric]] % —— A%

• Character-string-variable name:

Upper-case alphabetic character [alphanumeric

[alphanumeric]] \$ —— ABC\$

• Bit-string-variable name:

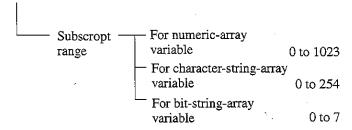

Upper-case alphabetic character [alphanumeric

[alphanumeric]] # — A#

· Array variable

The variable (declared as an array by the DIM statement) is called an array variable. Some system variables are also handled as array variables. The format of the array variables is shown below.

Array variable: variable (numaric constant or numeric variable)

NOTES

- The subscript range for an array variable is from 0 to array size -1.
- When the subscript in the array variable is a real number, it is truncated after the decimal point.
- Up to 256 variables can be used (except for system variables).
- Pre-registered symbols (such as commands, statements, functions and system variables)
 cannot be used as user-defined variable names.

(2) Common variables

Common variables are ones that can be commonly accessed from all programs (PTA program/library). The name of a common variable starts with "@" followed by capital alphabets. The length of a common variable name is 8 characters at longest, including the @ mark.

Values of common variables are retained until the RESET command or COMCLEAR command is executed. Common variables include simple variables and array variables:

Simple variables

There are numeric, character string and bit string variables.

- Real number variable name: @ + variable name
- Integer numeric variable name: @ + variable name + %
- Character string variable name: @ + variable name + \$
- Bit string variable name: @ + variable name + #
- · Array variables

Like array local variables, array common variables are declared by a DIM statement.

The DIM statement may be declared in any of programs, and double definition is also allowed. The array size is linear or quadratic.

- Real number variable name: @ + variable name (array size [, array size])
- Integer numeric variable name: @ + variable name + % (array size [, array size])
- Character string variable name: @[alphanumerics[alphanumerics]]\$ (array size [, array size])
- Bit string variable name: @ @[alphanumerics[alphanumerics]]# (array size [, array size])

Multi statement

By using '&' as the delimiter in a statement, multiple statements can be entered on the same line.

This delimiter can also be used to enter a program of two lines. There are no restrictions on the number of statements within a program, provided that the length of the program does not exceed two lines.

Example: 10 FOR I=0 TO 10 & A=I*I & PRINT A & NEXT I 20 STOP.

Functions

There are basic functions (arithmetic, boolean, statistical and character-string functions) and dedicated functions in PTL. The system functions are used for measurement evaluation.

(1) Arithmetic function

Function name	Function	Parameter	
Sine	SIN(X)	The X unit is degrees.	A constant or a variable os used for X.
Cosine	COS(X)		variable os used for X.
Tangent	TAN(X)	$X \neq \pm 90(2n+1)$, n:any integer	
Arcsine	ASN(X)	X ≤1	
Arccosine	ACS(X)		
Arctangent	ATN(X)		
Natural logarithm	LN(X)	X > 0	
Common logarithm	LOG(X)		
Exponent	EXP(X)		
Square root	SQR(X)	X ≥ 0	
Absolute value	ABS (X)		
Sign	SGN (X)	FOR X > 0, SGN(X) = 1 FOR X < 0, SGN(X) = -1 FOR X = 0, SGN(X) = 0	
Integer value	INT(X)	X: Numeric type constant variable (An integer less than X is returned.)	
Rounding up	ROUND(X[,N])	X: Numeric type constant variable N: Numeric type constant variable (default value: N = 0) (X is rounded up to the N-th decimal	place.)
Function to calculate the quotient and remainder	Q=DIV(R,S,D)	Q: Numeric variable Store: R: Numeric variable Store: S: Numeric variable Store: D: Numeric variable Store:	s the remainder s the dividend
Function to isolate the integer and decimal parts of a real number	I=FIX(S,D)	I : Integer variable Store S : Real-number variable Store of the D : Real-number variable Store	s the real number original value

(2) Boolean functions

Function name	Function	Parameter
Negation	NOT(X)	X and Y are constants and variable of bit type or numeric type,
Logical product	AND(X,Y)	and hexadecimal constants.
Logical sum	OR(X,Y)	
Exclusive OR	EOR(X,Y)	

(3) Statistical functions

Function name	Function	Parameter
Function to find maximum value	MX=max(S)	
Function to find	MN=min(S)	S: Variable defined as one-dimensional arrey
minimum value	MM=mili(S)	MX : Stores the maximum value
Function to find	SM=sum(S)	MN: Stores the minimum value
Function to find mean value	MS=mean(S)	SM: Stores the sum total MS: Stores the mean value
Function to find variance value	VR=var(S)	VR : Stores the variance $Variance = \frac{\sum (X - X)^2}{\text{No of samples}}$
Function to find all above values	VR=sta (S,MX, MN,SM,MS)	No of samples

NOTES

The left side always consists of numeric variable in which found (calculated) value is stored. The one-dimensional S-parameter is valid even if there is only one element provided. When all the elements are to be processed statistically, no subscript is necessary at the entry. If a subscript is included, only the element specified by the subscript will be processed.

(4) Character-string functions

- (a) Interchange between numerics and characters (strings)
 - ASC (Alphabetic constant or variable)
 ASC generates the character code for the first character of the string.
 - 2. CHR\$ (Constant or variable)

CHR\$ generates the character with the character code corresponding to the parameter value. For a character type, the character remains unchanged. The parameter range is from 0 to 255.

3. STRING\$ (Numeric constant or variable, constant or variable, character constant or variable) STRING\$ generates the characters (with the character code of the numeric value or the first character of string specified by the 2nd parameter) by the number of characters specified by the 1st parameters. Up to 255 repetitions may be specified.

Refer to CHR\$ ()

4. HEX\$ (numeric-value-type constant or variable 1 [, numeric-value-type constant or variable 2])

A decimal value of the first parameter is given as a hexadecimal character string with number of digits specified by the 2nd parameter.

An error will occur if the value of the first parameter does not fall in between -2^{31} and $2^{32}-1$. An error will occur if the second parameter goes beyond eight digits. When omitted, the return value will be of variable length.

- 5. OCT\$ (Constant or variable)
 - OCT\$ generates the octal character string corresponding to the parameter value. An error is generated when the range -32768 to 32767 is exceeded.
- 6. BIN\$ (numeric-value-type constant or variable I [, numeric-value-type constant or variable 2])

 A decimal value of the first parameter is given as a binary character string with number of digits specified by the 2nd parameter.

An error will occur if the value of the first parameter does not fall in between -2^{31} and $2^{32}-1$. An error will occur if the second parameter goes beyond 32 digits. When omitted, the return value will be of variable length.

- 7. CVI (Character constant or variable of 2 or more characters)
 - CVI generates the value converted from a character string to an integer numeric expression. If the character string exceeds two characters, the excess part is disregarded. Conversely, an error is generated when it is less than 2 characters.
- 8. CVD (Character constant or variable of 8 or more characters)
 - CVD generates the value converted from a character string to a double-precision real-number numeric expression. When the character string exceeds 8 characters, the excess part is disregarded. Conversely, an error is generated when it is less than 8 characters.
- 9. MKI\$ (Integer constant or variable)

MKI\$ generates the corresponding character code of the internal binary expression of the specified numeric value. This is the reverse process of the previously-mentioned CVI.

10. MKD\$ (Double-precision real-number constant or variable)

MKD\$ generates the corresponding character code of the internal binary expression of the specified numeric value. This is the reverse process of the previously-mentioned CVD.

11. VAL (Character variable, Number constant or variable 1, numeric constant or variable 2)

VAL isolates the mth to nth numeric characters (including other than numeric code) of the specified data string and changes them to the double-precision real-number numeric expression, assuming that m and n are the specified values by variable 1 and variable 2, respectively.

Both m and n may be omitted. When m is omitted, the object runs from the head character of the data string: and when n is omitted, the object runs to the last character of the data string.

An error occurs when no numeric character is found.

12. BVAL (character constant or variable)

This function will convert the parameter string notated in binary into an unsigned decimal value.

An error will occur if the parameter exceeds 32 bits. All characters other than "0" or "1" will be ignored.

13. HVAL (character constant or variable)

This function will convert the parameter string notated in hexadecimal into an unsigned decimal value. An error will occur if the parameter exceeds 32 bits (8 characters). Characters other than "0" to "9" and "A" to "F" are ignored.

14. CHR (Numeric constant or variable)

CHR generates the same character string as that to be displayed by the PRINT statement within the specified numeric value by parameter.

15. STR\$ (Numeric constant or variable)

This performs exactly the same processing as described for the CHR function.

(b) Retrieving character strings

1. INSTR ([Numeric constant or variable,] character constant or variable 1, character constant or variable 2)

When character string 2 is found within character string 1, its position is returned; if it is not found, 0 is returned. When the numeric value is included in the 1st parameter, the search starts from the indicated position with the numeric value; when it is omitted, the search starts from the header. The range of the value is from 1 to 255.

2. LEFT\$ (Character constant or variable, numeric constant or variable)

This gives the specified number of characters (counting from the left) as specified by the second-parameter. When the specified number exceeds the number of characters in the strings, whole the character string is given. The specifiable number is from 0 to 225. When the specified number is 0, a null string is returned.

3. MID\$ (Character constant or variable, numeric constant or variable 1, numeric constant or variable 2) This gives the n of character strings from the m-th character, assuming that the m and n are the specified values by the variable 1 and variable 2, respectively. The range of m/n is (1 to 256)/(1 to 255), respectively. When m exceeds the total number of characters, a null string is returned.

- 4. RIGHT\$ (Character constant or variable, numeric constant or variable)

 This performs the same processing as the LEFT\$ () command but from the right side. The value range is also the same (0 to 255). Note that this command does not reverse the character string sequence.
- 5. LEN (Character constant or variable)

 LEN gives the number of characters in a character string including all character codes from 0 to \$1F.
- 6. SLEN (character type constant or variable)

 This gives the number of characters composing a character string in the same manner as specifying a value in LEN ().

 However, this gives the length with the space at the end of the character string omitted.
- SGET\$ (character type constant or variable)
 This gives a valid character string with the space at the end omitted.

(5) Dedicated functions

Function description	Function	Parameter
Reads the error code and line number in which error occurred on	V=ERRREAD(m)	m 0 : Error code 1 : Line number in which error occurred
Reads the type of event	A#=STATUS(m)	m 0 : Event 0 1 : Event 1 2 : Event 2 3 : Event 3
Reads the date and o'clock, minute, second	A\$=DTREAD\$(m)	m 0 : Date (YY-MM-DD) 1 : o'clock, minute, second (HH:MM:SS)
Random number generation (more than 0, less than 1)	RND(m)	m : Specify an arbitrary value.

NOTES

- ERRREAD (m) can only be used during at error interrupt. For details on error interrupts, see Section 4, "ON ERROR statement".
- STATUS (m) can only be used during an event interrupt. For details on event interrupts, see Section 4, "ENABLE EVENT statement".
- · m is a numeric constant or numeric variable.
- The sequence of pseudo-random numbers generated by RND(m) becomes the same each time RUN is executed.
 - See Section 4, "RNDMIZE statement" for how to change the sequence.

Arithmetic operators

(1) Function

These operators perform addition, subtraction, multiplication, division, and exponential operations.

(2) Format

= ... Substitution

... Addition

- ... Subtraction

* ... Multiplication

/ ... Division

Exponentiation

() ... Represents operation priority

(Operations in parentheses are performed first.)

(3) Operation Priority

The operation priority is shown below.

Table 4-1 Operation priority of arithmetic operators

Operation priority	Arithmetic operators
High	1
	* /
\	+ -
Low	=

NOTES

- Bits and characters cannot be used in operations.
- If X of X! Y is a minus number, but Y is a plus number, X! Y can be operated.
- If there is a different type variable on the right side of an equals sign (=), an overflow or underflow error may occur.
- Number of digits of divided becomes number of digits of the solution on division with numerals or variables.

(4) Example

A\$="abc" C = (D+100)/E J = ((K+1)*10-M)*10

Relational operators

(1) Function

These operators perform relational operations.

(2) Format

```
= ... Equal (=)

>< or <> ... Not equal (≠)

> ... Greater than (>)

<= or =< ... Equal to or less than (≤)

< ... Less than (<)

>= or => ... Equal to or greater than (≥)
```

(3) Comparing character strings

When comparing the sizes of character strings, count only significant characters. (Ignore any spaces at the ends of the character strings to the left and right of an operator)

If two character strings are the same length, their characters are compared sequentially from the beginning.
 The first character which is different is found. The character which has the lower code value will determine the smaller character string.

Example: ABC is smaller than ABX.

• If two character strings are different lengths, the character strings over their common length are compared.

If the two strings are equal over this length, the shorter character string will be the smaller character string.

Examples: ABX is larger than ABCD.

ABC is smaller than ABCD.

• The smallest character string is one with 0 length.

Example: The length of A\$ is 0 when DIM A# (10) is declared.

(4) Examples

```
IF C=Ø GOTO 1ØØ

IF JKL>=168 STOP
```

String concatenation (the "+" operator)

(1) Function

String concatenation is possible with the "+" operator.

(2) Format

```
character string constant
character string variable
character string function
character string function

character string function
```

Notes:

- · Only be used with the right hand parameter of the LET statement.
- · You cannot concatenate character string and numeric values, character string and bit, or bit and bit.

(3) Examples

```
100
    A$="ABC"
110
    B$="DEF
    A=INSTR(A$,"")-1
12Ø
    B=INSTR(B$,"_")-1
13Ø
    C$=LEFT$(A$,A)+LEFT$(B$,B)
    PRINT "A$=",A$

    PRINT "C$=",C$
AS=ABC_____
B$=DEF______
C$=ABCDEF __ _ _
                     Space
```

NOTES

- Simple character-string variables are assumed to be a ten-character array-declared variables, implicitly. Therefore, characters not assigned will be filled with spaces. For details, see Section 4, "Display (PRINT statement)" and "Reverse display (PRINTR statement)".
- By using the above method, you can concatenate actual stored character only.

Formats

(1) Function

These formats specify the format of strings in output operations. Integers, real numbers without exponents, real number with exponents, strings, binary numbers, and hexadecimal numbers can be specified.

(2) Formats

- Integer
 - : I number of digits

(1 to 18)

- · Real number without exponent
 - : F <u>number of all digits</u> number of fractional digits

(4 to 20)

(Number of all digits ≥ number of fractional digits+3)

- Real number with exponents
 - : E <u>number of all digits</u>. number of fractional digits

(9 to 24)

(Number of all digits ≥ number of fractional digits+8)

- String
 - : C number of digits

(0 to 255)

- Binary number
 - : B number of digits

(1 to 8)

- · Hexadecimal number
 - : H number of digits

(1 or 2)

(3) Examples

PRINT A\$:C3,J:F1Ø.4

NOTES

- When number of digits is 0 for string, the character length becomes variable to output all actual length of the character string variable.
- A single space is included at the end of each PRINT statement provided that the FORMAT specifiers are capitalized. These spaces can be omitted by using a small-case FORMAT specifier instead of a capitalized FORMAT specifier (See Section 4, "Display(PRINT statement)" and "Reverse display (PRINTR statement)".)

Label

(1) Function

A jump address can be assigned indirectly by using a label with a line number in a statement such as GOTO or GOSUB.

(2) Format

```
Line number _* label _statement
```

- A label consists of up to eight alphanumeric characters starting with an uppercase alphabetic character. The label is prefixed with *.
- When multiple line numbers are defined with the same label, an error occurs during program execution.

(3) Examples

- 1Ø INPUT A
- 2Ø IF A=Ø GOSUB * ABC1
- 3Ø IF A<>Ø GOSUB * ABC2
- 4Ø GOTO 1Ø
- 100 * ABC1
- 11Ø PRINT "OK!"
- 12Ø RETURN
- 2ØØ * ABC2
- 21Ø PRINT "NG!"
- 22Ø RETURN

Basic Statements

Comment (REM statement)

(1) Function

This statement gives comments to program. These comments are not executed by the system and they have no effect on program execution.

Note: When a specific statement is described as a comment statement, it must be enclosed by a pair of double quotation marks(" ") as a character constant.

(2) Format

```
REM ["comment"] or
' [comment]
```

(3) Examples

- 10 REM
- 20 REM "Compute average"
- 30 'Compute average
- 40 A=100 'Initial set

Array declaration (DIM statement)

(1) Function

This statement declares arrays. Arrays must be one-dimensional or two-dimensional, and are restricted at a size as shown in paragraph (2) below according to the type of variable name.

(2) Format

```
DIM variable-name(array-size[,array-size])
    [,variable-name(array-size[,array-size])....]
```

Notes:

- The same variable name cannot be redefined as an array. A variable (that has been used as an independent variable) cannot be declared as an array.
- Error W225 will be generated when a two-dimensional array is referred to without the specification of two
 dimensions.
- Error W224 will be generated when a one-dimensional array is referred to as a two-dimensional array.
- The size limit of the declarable array is as follows. If the declared size exceeds these limits, ERROR 203
 will be generated.

Character type	1 to 255	Two dimensional array:		
Bit type	1 to 8	One dimensional side	Two dimensional side	
Numeric type	1 to 1024	1 to 1024	Character type	1 to 255
			Bit type	1 to 8
			Numeric type	1 to 1024

- For the numeric type, the program area will become insufficient; thus, it is impossible to define 1024 on both the one- and two-dimensional sides. In this case, ERROR 206 will be generated.
 The total number of array elements that can be declared (product of the number of one-dimensional array elements by the number of two-dimensional array elements) is not restricted because it depends on the
- · For the character array, ten characters long are automatically declared when no array is declared.
- · For the bit type, array eight bits long are automatically declared when no array is declared.
- Error W224 occurs when individual elements are referred to (read or written) without the appropriate array declaration.

(3) Examples

```
DIM CARR(100),A$(5,12)

DIM I#(8),ALP$(40)
```

capacity of empty memory.

(4) System variables which have been unconditionally declared as arrays.

NOTES

* is an array element of 0 to 500.

Initialization (CLEAR statement)

(1)	rundion
	Initializes user defined variable

(2) Format

CLEAR

Note: When the CLEAR statement is executed, the array can be redefined since variables are re-initialized in a manner similar to that in which executing RESET is executed.

Substitution (LET statement)

(1) Function

This statement substitutes variables for constants, variables, and results of operations. See Section 4, "Arithmetic operators".

(2) Format

Notes:

- · Bits and characters cannot be used in operations.
- If a substitution statement is placed after an IF statement, LET cannot be omitted.

(3) Examples

Branch (GOTO statement)

(1)) Fu	inction

This statement changes the sequence of program execution to the statement of the specified line number.

(2) Format

GOTO line number or GOTO * label

Termination of execution (STOP statement)

(1) Function

This statement terminates program execution after displaying an execution termination message on the CRT screen as follows.

STOP IN line number

(2) Format

STOF

Note: Suspension specifications are ignored in STOP statements, since program execution is terminated.

Branch to subroutines (GOSUB statement)

(1) Function

This statement changes the program execution to the subroutine with the specified line number. When the RETURN statement is executed at the end of the subroutine, the program execution is returned to the statement following the GOSUB statement.

(2) Format

GOSUB line number or GOSUB * label

Note: Calling another subroutine during execution of a subroutine is referred to as "nesting". Up to 10 nesting levels are permitted.

Return from subroutines to main routine (RETMAIN statement)

(1)	Function
	When the RETMAIN command is used during program execution, control is returned to the highest level
	the routine regardless of the nesting level.
(2)	Format
	RETMAIN
	Note: If the RETMAIN command has been executed in the highest level of the routine, ERROR F213 occurs.
Re	eturn from subroutines (RETURN statement)
(1)	Function
	This statement returns program execution from the subroutine to the statement following the corresponding GOSUB statement.
(2)	Format
	RETURN

Decision (IF statement)

(1) Function

If the result of the relational operation is true, this statement executes the subordinate statement. For relational operators, see Section 4, "Relational operators".

(2) Format

Notes:

- All statements including IF statements can be placed as subordinate statements.
- · Relational operations can not be performed among numerical values, characters, and bits.
- If a substitution statement is placed after an IF statement, LET cannot be omitted.

(3) Examples

IF C=1 GOTO 100

IF ACH\$=BCH\$ PRINT ACH

IF C<10 IF C>=20 PRINT "ERROR"

IF C<10 LET C=10

Repetitions start (FOR statement)

(1) Function

This program loop causes the program code (located between the FOR and NEXT) to be repeatedly executed, until the specified variable is equal to or greater than the specified end value.

Up to 10 nesting levels may occur within a FOR statement.

(2) Format

Notes:

- Even if the initial value exceeds the end value, one operation cycle will be performed.
- NEXT statements may be used anywhere; however, for proper execution they must be properly positioned.

(3) Example

```
FOR C=1 TO 100

FOR T=TB TO TE STEP 0.1

FOR D=-1 TO -10 STEP -1

NEXT D

NEXT T

NEXT C
```

Repetition termination (NEXT statement)

(1) Function

This statement is used with its corresponding FOR statement to terminate the repeated operation.

(2) Format

NEXT numeric variable

Same variable as that specified in FOR statement

Key-input (INPUT statement)

(1) Function

This statement is used to assign data input from the front panel key to variables. When the statement is executed, the following message is displayed on the CRT.

?

Input data after the display question mark? via the numeric key of the front panel, then press [ENTER] key of the instrument.

Use commas (,) as delimiters of data if required.

(2) Format

INPUT ["displayed character string",] variable[,variable....]

Notes:

- If a real number is input for an integer variable, it is truncated under decimal point.
- If the input data length is smaller than that which has been declared, spaces are appended to the entry. If it is greater, the excess digits will be truncated.
- For numeric and bit type variables, spaces before and after the input value are ignored.
- · Hexadecimal data cannot be input.
- Five variables can be specified.
- The ,(comma) and -(minus) are input by pressing the [kHz] key and the [MHz] key of the front panel, respectively.

(3) Examples

```
INPUT "COUNT=",C \rightarrow COUNT=? 123
INPUT C,A$,I# \rightarrow ? 123,Q,101101
```

Display (PRINT statement)

(1) Function

This statement edits and displays data on the CRT screen.

Unformatted data is displayed with spaces added after its effective digits. The format name and output formats are shown in Table 4-2.

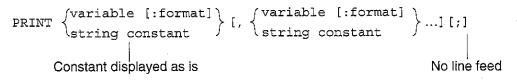

For the format, see Section 4, "Formats".

Line feed is disabled by adding ";" at the end.

Table 4-2 Format Name and Output Format

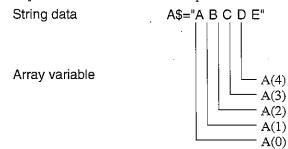

Format name	Output format
I	Zero-suppressed integer (Ex 123)
F	Zero-suppressed integer and zero-suppressed fraction (Code digit exists.) (Ex123.45_)
FP	Zero-suppressed integer and zero-suppressed decimal number (unsigned) (Ex123.45_)
E	Zero-suppressed fraction E [-] exponent (Ex1.23E-2_)
C	String If the size of data is smaller than the specified format size, spaces are added; and if it is greater, the excess lower digits are truncated.
B H	Zero-suppressed binary-number/hexadecimal-number string (Ex 1011)

(2) Format

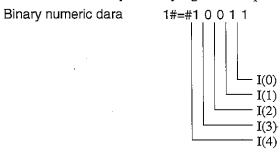

Notes:

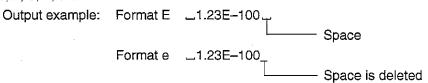

- Up to five variables or constants can be specified.
- Values which cannot be expressed are displayed as ***...*.
- A string-which is an array of character variables- is comprised as follows:

• A binary numeric variable- which is an array of binary digits- is comprised as follows:

• The last space can be deleted by using a lower-case format i, f, fp, e, c, b, or h instead of an upper-case format I, F, FP, E, C, B, or H.

Only plus values are significant in format FP.

(3) Data and print output examples

Table 4-3 shows data and output examples.

Table 4-3 PRINT-Statement Output Example

Format	Data	Statement	Output
(None)	T=1234.45	PRINT_T .	123.45_
	A\$="ABCD"	DIM_A\$(5)	
		PRINT_A\$	ABCD

Note

Example with the DIM statement means the array declaration is performed for the variable. If no DIM statement is marked, it means there is no array declaration for the variable.

Reverse display (PRINTR statement)

(1) Function

Edits data and displays the data on the screen in reverse mode. See Section 4, "PRINT statement" for details.

(2) Format

- Only characters of character codes 0 to 127 can be displayed in reverse mode.
 PRINTR containing other character displays has the same function as that of PRINT. In this case, PRINTR displays characters in normal mode.
- A line in which characters of character codes 128 to 255 are displayed cannot be displayed in reverse mode. In this case, PRINTR has the same function as that of PRINT, and it displays characters in normal mode.

Positioning the cursor (LOCATE statement)

(1) Function

This statements specifies the cursor position on the screen. (Referred to at the upper left on the screen)

(2) Format

LOCATE (m, n)

 $m \rightarrow column position (1 to 40)$

 $n \rightarrow line position (1 to 20)$

Note: Both m and n are numeric constants or variables.

Data statement (DATA statement)

(1) Function

This statement defines numeric, bit and character constant to be read with the RDATA statement.

(2) Format

DATA, constant, constant,

Note: Any number of parameters maybe input in a DATA statement provided that it does not exceed two lines. Further, different types of constants may be input in a single DATA statement.

Reading data (RDATA statement)

(1) Function

This statement reads values from the DATA statement and assigns them to variables.

(2) Format

RDATA variable, variable, *******

Notes:

- Any number of parameters maybe assigned in an RDATA statement provided that it does not exceed 2 lines. Further, different types of constants may be input in a single RDATA statement.
- If the definition type in the DATA statement and the type of the substituted variable are incompatible at data reading with the RDATA statement, ERROR W208 will be generated.

Read specification of data statement (RESTORE statement)

(1) Function

This statement specifies the data statement to be read with the RDATA statement.

(2) Format

RESTORE [line number or *label]

Example:

```
100 RESTORE 1000
```

11Ø FOR I=Ø TO 1Ø

12Ø RDATA A(I)

13Ø NEXT I

1000 DATA 0,1,3,7,9,11,13,17,19,23,29

Note: When the RESTORE-statement parameter is omitted, the first data statement is used.

Setting measurement parameters (PUT and WRITE 1000 statements)

(1) Function

Sets the spectrum analyzer measurement parameters from the PTA.

The same messages as those set by remote control are used.

This command is also used when sending inquiry messages to the spectrum analyzer.

(2) Format

PUT character constant or character variable WRITE 1000, variable or character constant [,variable or character constant]

1) PUT statement

- A message of the same format as remote control is described in operands.
- Only a character constant or character variable can be described in the operands.
- Only one constant or variable can be described.
- The format cannot be specified.
- When a fixed value is set at all times, the program can be simplified using this statement.

Examples:

```
PUT " CF 500MHZ"
```

→ Set measurement parameter center frequency to 500 MHz.

```
PUT " CF?"
```

→ Send measurement parameter center frequency inquiry message.

2) WRITE 1000 statement

- A message of the same format as remote control is described in operands.
- Variables or character constants can be described in the operands.
- · Up to five constants or variables can be described.
- When variables are used, the format can be specified.
- This statement is effective when setting is performed several times with only part of the control message being changed and when values treated as variables are set values in the program.

Examples:

```
F=5ØØ
```

```
WRITE 1000, "CF ", F, "MHZ"
```

→ Set measurement parameter center frequency to 500 MHz.

WRITE 1000, "CF?"

→ Send measurement parameter center frequency inquiry message.

Measurement parameter/data read (GET, COM and READ 1000 statements)

(1) Function

Reads the spectrum analyzer measurement parameters and the measured result from the PTA. The same messages as those set by remote control are used.

(2) Format

```
GET "inquiry command?",input variable

COM "inquiry command?">input variable[, input variable]

READ 1000, input variable[, input variable] or

READ 1000, input variable[;]
```

1) GET statement

- An inquiry command can be sent and the response data can be read with one statement. Only one inquiry
 command can be described in one statement.
- Only a character constants or character variables can be described in the "inquiry command" parameters. Only one constant or variable can be specified. The format cannot be specified.
- The response data is stored in the input variable. When the response data contains a character, a character variable is specified. When the response data is numeric (numeric character) only, it may be a numeric variable or a character variable.
- When the response data consists of multiple data separated by a ",", everything up to the last data is stored
 in one variable as one data. Therefore, when a character variable is specified, if the array size is too small,
 all the response data may not be stored.
- Only one input variable can be specified. A ";" cannot be specified at the end of the statement.
- · When the same inquiry command is always sent, the program can be simplified using this statement.

Example:

```
GET "CF?", A$
```

→ Send the center frequency inquiry message and store the response data in input variable A\$.

2) COM statement

- An inquiry command can be sent and the response data can be read with one statement. However, only one inquiry command can be described in one statement.
- Character constant or character variable or character constant and character variable can be specified in the "inquiry command" parameter.

The format can also be specified for variables.

- The response data is stored in the input variable. When the response data contains a character, a character variable is specified. When the response data is numeric (numeric character) only, it can be a numeric variable or character variable.
- Multiple variables can be described. When the response data consists of multiple data delimited by a ",",
 the delimited data are stored sequentially in the specified variables.
- A ";" cannot be specified at the end of the statement.

However, array variables cannot be used as input variables.

• This statement is effective when reading is performed several times with only part of the inquiry message changed and when sending an inquiry message for a value treated as a variable in the program.

Example:

```
I=1
COM "MKML? ", I>ML
```

→ Send the 1st marker level inquiry message of the multimarker, and store the response data to input variable ML.

Note: The inquiry message for each level of the multimarker is specified by "MKML? n" (n: multimarker No.).

This statement is useful for reading the level of each marker by changing only the value of n.

3) READ 1000 statement

- This statement reads the response data only. Therefore, it is effective only when a PUT or WRITE 1000 statement is used to send an inquiry message.
- The response data is stored in the input variable. When the response data contains a character, a character variable is specified. When the response data is numeric (numeric character) only, it can be a numeric variable or character variable.
- Multiple input variables can be described. When the response data consists of multiple data delimited by a ",", the delimited data is stored sequentially in the specified variables.
- When the response data is treated as one data, even when it consists of multiple data delimited by a ",", the entire response, including the ",", can be stored in one variable by specifying ";" at the end of the statement. In this case, only one input variable can be specified. Data delimited by a "," can also be read by specifying only one variable without a ";" at the end and executing this statement repeatedly.
- When there is no response data, "***" is output.

Example:

```
WRITE 1000, "CF? "
READ 1000, A$
```

 \rightarrow Store the response data to the center frequency inquiry command in A\$.

Program loading and execution (CHAIN statement)

	_	
(1)		nction
		17 11 11 11 1
111		IVEIVE

This statement loads and executes a file in memory card.

(2) Format

CHAIN "file name"

Note: The RUN, CONT or STEP commands (set in the execution state) remain valid even after the CHAIN command is executed. Consequently, the lines at which execution is suspended also remain effective.

ENABLE EVENT statement

(1) Function

Enables the specified interrupt.

When the specified interrupt occurs, the program will branch to the event interrupt subroutine defined by the ON EVENT statement.

(2) Format

ENABLE EVENT I/O number, event 3, event 2, event 1, event 0

- There are 2 types of I/O numbers: numeric variables and numeric constants.
- Events 0 to 3 can be numeric variables and constants, bit variables and constants, or hexadecimal constants.
- · This statement can be executed directly.
- Events 0 to 3 indicate 32 bits of I/O interrupt events as shown below.
- The defined bits (b0 to b31) are enabled when "1" and disabled when "0".
- When the master bit (b31) was set to "1", all the defined conditions are valid regardless of the value of bits b0 to b30.

b31	b24	b23	b16	b15	b8	b7 .	b0
Event 3		·	Event 2		Event 1		Event 0

(3) Types of I/O interrupts

(a) Time-specification interrupts

Three kinds of time-specification interrupts are available.

1) DELAY

Generates an event interrupt after the specified time has elapsed.

The time can be specified as a remote control command or by a PUT or WRITE statement.

DELAY setting

"EDLY t" t: 0 to 3600 (s) 1 sec resolution

- Time counting starts from the time set by this command.
- When the time is reset during counting, counting restarts.
- If t=0 was set, counting is interrupted.
- · There is no set value t inquiry command.

2) Time

Generates an event interrupt at the specified time.

The time can be specified as a remote control command or by a PUT or WRITE statement.

Time setting

"ETIM t1, t2, t3"

- t₁: Specifies the hour. (0 to 23)
- t2: Specifies the minute. (0 to 59)
- t₃: Specifies the second. (0 to 59)
- When the time is reset during counting, counting restarts.
- There are no set value t1, t2, and t3 inquiry commands.

3) Cycle

Generates an event interrupt at the specified cycle (time).

The cycle can be specified as a remote control command or by a PUT or WRITE statement.

Cycle setting

"ECYC t" t: 0 to 3600 (s) 0.1 sec resolution

- If t=0 was set, time counting is interrupted.
- There is no set value t inquiry command.

(b) Soft keys and data knob interrupt

1) Soft keys ([F1] to [F5])

When a PTA menu (3/4) [F1] to [F5] key (corresponding to system variables EX1 to EX5) is pressed, an event interrupt is generated. This also applies to the PTA keyboard [F1] to [F5] keys.

2) Cursor control keys

When the PTA menu (2/4) [CURSOR UP: F2] key or [CURSOR DOWN: F3] key is pressed, an event interrupt is generated.

3) Data knob

When the data knob is turned, an event interrupt is generated.

However, when the spectrum analyzer measurement parameter setting is effective, an event interrupt is not generated.

Clockwise and counterclockwise revolution can be detected.

I/O type	I/O number	Contents
Clock (DELAY)	1	b31 b0 Interrupt occurrence
Clock (TIME)	2	Master bit b0 Interrupt occurrence
Clock (CYCLE)	3	b31 b0 Interrupt occurrence
SOFT KEY, data knob	11	b31 b17 b16 b9 b8 b4 b3 b2 b1 b0 [F1]Key [F2]Key [F3]Key [F4]Key [F5]Key [CURSOR DOWN:F3]Key Data knob right Data knob left Master bit Master bit

DISABLE EVENT statement

(1) Function

Disables the specified interrupt.

(2) Format

ENABLE EVENT I/O number[, event 3, event 2, event 1, event 0]

Notes:

- There are 2 types of I/O number: numeric variables and numeric constants.
- Events 0 to 3 can be numeric variables and constants, bit variables and constants, or hexadecimal constants.
- Events 0 to 3 may be omitted. When omitted, all interrupt events will be disabled.
- This statement can be directly executed.
- The defined bits are disabled when "1" and retain their previous enable/disable state when "0". However, master bit (b31) setting is meaningless. (Don't care)

ON EVENT statement

(1) Function

Registers the subroutine to branch to when the specified interrupt event occurs.

(2) Format

ON EVENT I/O number, line number(or * label)

- There are 2 types of I/O number: numeric variables and numeric constants.
- This statement can be executed directly.
- The function STATUS (M) is used as the interrupt event identifier. For more details, see Section 4, "Functions", (5) Dedicated functions.

RETINT statement

(1) Function

Returns from the event interrupt subroutine.

(2) Format

RETINT

- If any other return command is executed to return from an event interrupt subroutine, an execution termination error (F243) will be generated.
- If the RETINT command is executed for other than event interrupt, an execution termination error (F251) will be generated.
- It is possible to branch to a normal subroutine (GOSUB ... RETURN) from the event interrupt subroutine.

Character size specification (DCHSIZE statement)

(1) Function

Specifies the display character size at system subroutine DCH execution.

(2) Format

DCHSIZE Character size number

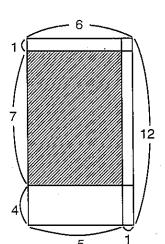

Character size number

0 Small font

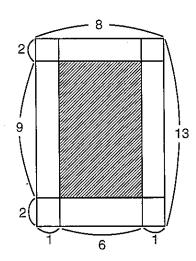

1 Medium font

• The patterns of small/medium character fonts are shown below:

Small font

Medium font

The units are dots on the CRT.

- The display character size can not be changed by PRINT statement, etc.
- Initialized by the RESET command.

Home position (H	OME	statement)
------------------	-----	------------

(1)	Function
(-)	This statement moves the cursor to the home position (upper left).
(2)	Format ————————————————————————————————————
	HOME
D	elete (ERASE statement)
,	
(1)	Function
	This statement deletes statements after the line with the cursor.
(2)	Format
()	ERASE
	Note: When only the PTA screen is erased from the display, the screen is only partially erased. To erase the screen entirely, use the system subroutine CFL (see Section 5, "CFL subroutine").
1	me wait (WAIT statement)
(1)	Function
	This statement is used to wait for a specified time period.
(2)	Format
	WAIT { Numeric variable } Numeric constant }
	Waiting time (unit: second, Ø.Ø1 s resolution)

System subroutine execution (CALL statement)

(1) Function

This statement is used to execute system subroutines.

For details of system subroutines, see Section 5, "System Subroutines".

(2) Format

CALL system subroutine name[(parameter[,parameter...])]

ON ERROR statement

(1) Function

Registers the subroutine to branch (interrupt) to when an error occurs.

(2) Format

ON ERROR line number (or * label)

- Execution is halted when an error occurs during the execution of an error processing subroutine.
- If there is an error statement right after the line where the error occurred, only the error statement will be
 executed.
- If the error is an execution termination error, no interrupt will occur.
- If an error occurs during data input with the INPUT statement, no interrupt will occur.
- The function ERRREAD (m) identifies the error code and line the error occurred. For details, see Section 4, "Dedicated functions".
- Multiple interrupts with event interrupts are possible.
- The error occurred during an error interrupt processing is not applied.

OFF ERROR statement

	123		_			•	
í	1	١.	⊢ 1	ın	ct	ın	n
ь		,	1 4	AL 1	\sim	··	, ,

Removes the registered subroutine to branch (interrupt) when an error occurs. No error interrupt will occur while after executing this command.

(2) Format

OFF ERROR

RETERR statement

(1) Function

Returns from an error interrupt.

Continues from the statement following the statement where the error occurred.

(2) Format

RETERR

- If the RETURN or RETMAIN commands are used to return from an error interrupt, an execution termination error (F243) will result.
- If the RETINT command is executed to return from an error interrupt, an execution termination error (F251) will result.
- If the RETERR command is executed when there is no error interrupt, an execution termination error (F252) will result.
- It is possible to branch to a normal subroutine (GOSUB ... RETURN) from the event interrupt subroutine.

RETRY statement

(1) Function

Returns from an error interrupt.

Execution is retried from the statement on which error occurred.

(2) Format

RETRY

Notes:

- If the RETURN or RETMAIN commands are used to return from an error interrupt, an execution termination error (F243) will result.
- If the RETINT command is executed to return from an error interrupt, an execution termination error (F251) will result.
- If the RETRY command is executed when there is no error interrupt, an execution termination error (F252) will result.
- It is possible to branch to a normal subroutine (GOSUB ... RETURN) from the event interrupt subroutine.

RESUME statement

(1) Function

Returns from an error interrupt.

Continues from the specified line.

(2) Format

RESUME line number (or *label)

- If the RETURN or RETMAIN commands are used to return from an error interrupt, an execution termination error (F243) will result.
- If the RETINT command is executed to return from an error interrupt, an execution termination error (F251) will result.
- If a command other than the RESUME command is executed when there is no error interrupt, an execution termination error (F252) will result.
- It is possible to branch to a normal subroutine (GOSUB ... RETURN) from the event interrupt subroutine.

GIVEUP statement

(1) Function

Returns from an error interrupt. Halts program execution.

(2) Format

GIVEUP

Notes:

- If the RETURN or RETMAIN commands are used to return from an error interrupt, an execution termination error (F243) will result.
- If the RETINT command is executed to return from an error interrupt, an execution termination error (F251) will result.
- If the GIVEUP is executed when there is no error interrupt, an execution termination error (F252) will result.
- It is possible to branch to a normal subroutine (GOSUB ... RETURN) from the event interrupt subroutine.

Error branch (ERROR statement)

(1) Function

To continue execution after warning-error generation, an ERROR statement can be used. Multiple lines can be used for ERROR statements.

See Section 8, "ERROR Statement" for details.

(2) Format

ERROR(error number, program line or *label to be executed next)

Error main (ERRMAIN statement)

(1) Function

This statement branches to the highest level routine when an error that allows execution to continue (error code beginning with the letter W) is generated while the program was running.

(2) Format

ERRMAIN(error number)

Notes:

- When an ERRMAIN statement was executed in the highest level routine, the error code becomes F213.
- See Section 8, "ERRMAIN Statement" for details.

Data input 1 (READ statement)

(1) Function

This statement is used to receive data from a device connected to the RS-232C or GPIB through the specified port.

(2) Format

READ address, input variable[,input variable....]
READ address, variable[;]

- When ";" is not added at the end of the statement, commas (",") in the received data are assumed to be data delimiters and are stored in each variable.
- When ";" is added at the end of the statement, commas (",") are not assumed to be data delimiters and everything up to the data terminator is stored in one variable.

Data input 2 (BREAD statement)

(1) Function

This statement is used to receive one byte of binary data from a device connected to the RS-232C or GPIB through the specified port. When the specified port is a device port, this statement cannot be executed.

(2) Format

BREAD address, input variable[,input variable....]

Data input 3 (WREAD statement)

(1) Function

This statement is used to receive one word of binary data from a device connected to the RS-232C or GPIB through the specified port. The data is stored in the input variable as high byte to low byte in sending order. When the specified port is a device port, this statement cannot be executed.

(2) Format

WREAD address,input variable[,input variable....]

Data output 1 (WRITE statement)

(1) Function

This statement sends data to a device connected to the RS-232C/GPIB/parallel (centronics) through the specified port.

(2) Format

WRITE address, variable[:format][,variable[:format]...][;]

- The output data can also be a character constant.
- When ";" is added at the end of the statement, a terminator is not output.
- The output destination depends on the addressing method and GPIB port mode (system controller/device).

Data output 2 (BWRITE statement)

(1) Function

This statement sends one byte of binary data to a device connected to the RS-232C/GPIB/parallel (centronics) through the specified port. When the specified port is a device port, this statement cannot be executed.

(2) Format

BWRITE address, variable[, variable...]

- · Neither format nor ";" can be specified.
- The terminator is not output.

Data output 3 (WWRITE statement)

(1) Function

This statement sends one word (two bytes) of binary data in order of high byte to low byte to a device connected to the RS-232C/GPIB/parallel (centronics) through the specified port. When the specified port is a device port, this statement is not executed.

(2) Format

WWRITE address, variable[, variable...]

Notes:

- Neither format nor ";" can be specified.
- The terminator is not output.
- When a one- or two-digit value is used (e.g. 5 or 17) for an address, the value becomes the address of the device connected to the port specified by the PORT command as a remore control command (Indirect Port specification). However, when a three-digit value (e.g. 105 or 217) is used, the first digit becomes the port address and the lower two digits become the address of the device connected to the port (Direct Port specification).
- The lower two digits of the address at indirect or direct port specification have no meaning in the RS-232C and parallel (centronics). However, these digits should still be specified for form's sake.
 Example:

WRITE_5,"ABC"	Data is sent to address 5 through the port specified by the
	PORT command (indirect port specification).
READ_100,A\$	Data is input from a device connected to port No. 1 (RS-
	232C) (direct port specification).
WRITE_205,"ABC"	Data is sent to address 5 through port No. 2 (GPIB) (direct
	port specification).
WRITE_300,"ABC"	Data is sent to a device connected to port No.3 (parallel
	(centronics)) (direct port specification).

These address specifications are effective for the WRITE, BWRITE, WWRITE, READ, BREAD, WREAD and LISTG statements.

The relationship between the port specification command and controller port is as follows:

	Indirect port specification	Direct port specification		
	WRITE 5	WRITE 1Ø5	WRITE 205 ,	WRITE 3Ø5
	*1	*1		*1
At power-ON or after	The RS-232C port	The RS-232C port	The GPIB port	The paralell
"PORT_1"	is a controller	is a controller	is a controller	(centronics) port is
execution	port.	port.	port.	the controller port.
		*1		*1
After "PORT_2"	The GPIB port	The RS-232C port	The GPIB port	The parallel
execution	is a controller	is a controller	is a controller	(centronics) port is
	port.	port.	port.	the controller port.
-	*1	*1		*1
After "PORT_3"	The parallel	The RS-232C port	The GPIB port	The parallel
execution	(centronics) port is	is the controller	is the controller	(centronics) port is
	the controller port.	port.	port.	the controller port.

^{*1:} Addresses specified in the RS-232C, parallel (centronics) have no meaning. However, these addresses should still be specified for form's sake.

Data writing to the dual port memory (WDPM statement)

145	-	
(1)	⊢ııı	nction
		10000

This statement writes data to the dual port memory. See Section 7, "Dual Port Memory" for details.

(2) Format

WDPM memory number, variable[:format][,variable[:format]....]

Notes:

- The output data can also be character constants.
- ";" cannot be specified.
- This statement can be executed regardless of the GPIB mode (system controller/device).

Data reading from the dual port memory (RDPM statement)

(1) Function

This statement reads data from the dual port memory. See Section 7, "Dual Port Memory" for details.

(2) Format

RDPM memory number, input variable [,input variable]

- ";" cannot be specified.
- · When data delimited by "," is input, multiple input variables are specified.

(1) Function

This statement is displayed in the statement where a syntax error is generated during program loading.

(2) Format

SOS

- A statement with SOS added is treated as a comment statement, the same as a REM statement, but when the program is run, it is treated as a syntax error.
- Line-number errors are treated as syntax errors (W6) and SOS is not displayed.

Setting the pseudorandom number sequence (RNDMIZE statement)

(1)	Function
	Sets a new initial value of a pseudorandom number sequence generated by the RND function.
(2)	Format
	RNDMIZE
·	Note: If this statement is not executed, the RND function in the program generates the same pseudo-random number sequence each time the program is executed.
Ca	alling the PTA library (CALLIB statement)
(1)	Function
	This statement calls the specified PTA library.
(2)	Format
	CALLIB "PTA library name" [,parameter]
	Numeric variable or constant (up to 10 parameters)
	Alphanumeric string with up to 8 characters starting with a capital alphabet
	Characters available for the 2nd character on:
	Under bar
	Capital alphabet: A to Z
	Small alphabet : a to z
	Numeral: 0 to 9

• The specified PTA library is called out. When the STOP statement is executed in the called PTA library, the system returns to the program where the CALLIB statement was executed.

However, small alphabets are converted to capitals.

- Up to 10 parameters can be sent to the called PTA library. In this case, parameter values are assigned to the local variables specified by the PARASET statement of the called PTA library. (See PARASET.)
- Nesting of the PTA library by the CALLIB statement is available up to 10 times.

Note: The PTA library, from the start line to the STOP statement, is counted as one program unit. (The STOP statement may come in the middle of the program.) The CALLIB statement calls this program unit.

Removing the PTA library from program memory (REMOVE statement)

(1) Function

This statement removes the specified PTA library from the program memory.

(2) Format

REMOVE ["PTA library name"]

Alphanumeric string with up to 8 characters starting with a capital alphabet
 Characters available for the 2nd character on :

Under bar

Capital alphabet : A to Z Small alphabet : a to z Numeral : 0 to 9

However, small alphabets are converted to capitals.

- The specified PTA library is removed from the program memory. However, it is not possible to specify the PTA library in execution (or an error is generated if specified).
- When this function is directly executed without specifying a program, all the PTA libraries in the memory are removed.
- When the PTA library specified as the object of the program execution and edition commands is removed by the EDITLIB command, the specification of the EDITLIB command is cleared.

Clearing common variables (COMCLEAR statement)

(1) Functi	on
------------	----

This statement clears all the common variables residing in the memory.

(2) Format

COMCLEAR

- All the common variables residing in the memory are cleared.
- When this statement is executed in the nested PTA library, an error is generated.

Setting CALLIB parameter values (PARASET statement)

(1) Function

This statement sets the parameter values sent from the CALLIB statement to the specified local variables.

(2) Format

PARASET Parameter[,parameter]

Up to 10 real-number local variables

• Parameters sent from the side that called the PTA library are set to local variables. Only the real-number local variable can be used. When common and other variables are specified, an error is generated at input. When the call side of the PTA library does not send parameters, the variable value is set to be zero.

Loading the PTA library file LOADLIB statement)

(1) Function

This statement loads the function-specified PTA library file.

(2) Format

LOADLIB "File name"

Alphanumeric string with up to 6 characters starting with a capital alphabet
 Characters available for the 2nd character on :

Capital alphabet : A to Z Small alphabet : a to z Numeral : 0 to 9

However, small alphabets are converted to capitals.

- The PTA library file saved in the memory card is loaded. If a PTA library named the same as one already existing in the memory is loaded, the content of the existing PTA library is replaced with that of the newly loaded PTA library.
- It is not possible to load the file in which a PTA library named the same as one in execution is saved.

SECTION 5 EXTENDED PTL

There are system variables, system functions, and system subroutines in the extended PTL.

The extended PTL can execute operations and evaluation of measurement results, and control external devices.

System Variables

PTA provides system variables with pre-defined names in addition to user-defined variables. Using these system variables, the measured data can be read.

Variable name	Number of array elements	Purpose	Data meaning	Read/ Write
EX1		Corresponding to F1 key	Numbers 0 and 1 are switched alternately each time the F1 key is pressed.	R/W
EX2		Corresponding to F2 key	Numbers 0 and 1 are switched alternately each time the F2 key is pressed.	R/W
EX3		Corresponding to F3 key	Numbers 0 and 1 are switched alternately each time the F3 key is pressed.	R/W
EX4		Corresponding to F4 key	Numbers 0 and 1 are switched alternately each time the F4 key is pressed.	R/W
EX5		Corresponding to F5 key	Numbers 0 and 1 are switched alternately each time the F5 key is pressed.	R/W
EX6		Corresponding to etc key of each hierarchy	0 to 3: Switches a PTA function key hierarchy (*)	R/W

Soft-key menus can be changed by inputting 0, 1, 2 and 3 to the system variable EX6, as shown below. However, EX6 is disabled when the PTA menus are not being executed.

Variable name	Number of array elements	Purpose	Data meaning	Read/ Write
DTØ		Time setting/reading (year: Gregorian calendar)	1960 to 2059	R/W
DT1		Time setting/reading (month)	0 to 12	R/W
DT2		Time setting/reading (date)	0 to 31	R/W
DT3		Time setting/reading (hour)	0 to 23	R/W
DT4		Time setting/reading (minute)	0 to 59	R/W
XMA	501	Waveform memory of TRACE-A	Waveform data in 0.01dBm unit	R/W
XMB	501	Waveform memory of TRACE-B	Waveform data in 0.01dBm unit	R/W
XMG	501	Waveform memory of TRACE-BG	Waveform data in 0.01dBm unit	R/W
XMT	501	Waveform memory of TRACE-Time	Waveform data in 0.01dBm unit	R/W
SMA	501	Submemory A	-32768 to 32767: 2-byte integer/1 point	R/W
SMB	501	Submemory B	-32768 to 32767: 2-byte integer/1 point	R/W
SMT	501	Submemory Time	-32768 to 32767: 2-byte integer/1 point	R/W
IMA	501	Image memory A	-32768 to 32767: 2-byte integer/1 point	R/W
IMB	501	Image memory B	-32768 to 32767: 2-byte integer/1 point	R/W
RMA	501	Real number memory A	8-byte floating point real number/1 point	R/W
RMB	501	Real number memory B	8-byte floating point real number/1 point	R/W

	EX6 = 0 EX6 = 1		EX6 = 2	EX6 = 3
F1	RUN	PLIST	F1 *	YES
F2	STOP	CURSOR UP	F2 *	NO
F3	CONT	CURSOR DOWN	F3 *	(None)
F4	RESET	LOAD	F4 *	(None)
F5	PTA OFF	RUN	F5 *	(None)
F6	etc (1/4)	etc (2/4)	etc (3/4)	etc (4/4)

^{*} Display cheracters can be defined with DEF subroutine.

System Subroutines

The MS2665C/67C/68C PTA has dedicated subroutines, called the system subroutines, executed by the CALL statement.

The system subroutines are shown below:

Display subroutines

• Displayed item erase : CALL CER (M)

• Screen restore: CALL CRN (M)

• Screen erase : CALL CFL (M)

• Character-string display: CALL DCH(X,Y,text,M[,N])

• Straight-line display: CALL DLN (XØ, YØ, X1, Y1, M[, N])

• Square display: CALL DRC(XØ, YØ, X1, Y1, M[, N])

• Circle display: CALL DCR(X,Y,R,M[,N])

• Arc-line display: CALL DAR (XØ, YØ, RØ, W1, W2, M1[, M3])

• Soft-key label registration: CALL DEF (M, text)

■ File-operation subroutines

• File open (read): CALL OPNI_character string variable

(or character constant)

• File open (write): CALL OPNO_character string variable

(or character constant)

• File delete: CALL FDEL_character string variable

(or character constant)

• Data load: CALL DALD variable

• Data save: CALL DASV variable

• File close: CALL CLS

■ GPIB subroutine (GPIB port only)

• Interface clear : CALL IFC

(Changeover to system controller port)

• Service request: CALL RSV (M)

• Take controller: CALL TCT (M)

Changeover to device port : CALL DEV

■ Interface subroutine

• Status byte reading: CALL GST (port number, address, input variable)

• Interface control: CALL GPIB (port number, control item number)

■ Panel subroutines

• Front-panel operation lock: CALL PNLL(Ø)

Front-panel operation lock cancellation : CALL PNLU (Ø)

■ Waveform memory subroutine

• Memory copy: CALL COPY (MØ, M1)

Data conversion: CALL CONV(K, MØ, M1, PØ, P1[, D])

• Frequency axis logarithm conversion: CALL SWLG(K, MØ, M1)

NOTES

If parameters specified in each subroutine are outside the specified range, an error occurs and no graphic data is plotted.

CER and CRN subroutines

(1) Function

The CER/CRN subroutines perform erasure and display restoration of the character string, graph, scale, marker, etc. on the CRT screen.

(2) Format

CALL_CER(MØ)	 Erases items MØ
CALL_CRN(MØ)	 Restores items MØ display

MO	ltem
0	Marker frequency, level, AT, RB
1	RLV, ST, VB
2	Frequency
3	Menu, data input area
4	Sweep marker
5	Scale line, Y-axis scale
6	Waveform
7	Markers, zone
8	Message in scale
9	Title, trace item, trigger switch, sweep status
10	All items above

- See Section 1, "Screen Configuration of PTA" for the screen details.
- A numeric constant or numeric variable is used for M0.
- When clear/display return was performed with this subroutine, the state is held until it is reset by this subroutine or until the PTA is turned off.

CFL subroutine

(1) Function

This subroutine erases display items of each frame constituting the screen.

(2) Format

CALL_CFL (M1)

M1 (Frame No.)	Display item
0	Waveform background
1.	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
6	Display line
7	Trigger indicator
8	Marker zone
, 9	Template/mask standard line
10	Multi-marker No.
11	(Not used)
12	Marker/marker value display
13	Menu background
14	Menu characters
15	Setting and parameter characters, error message

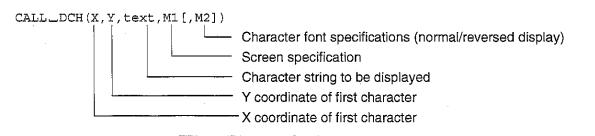

- A numeric constant or numeric variable is used for M1.
- This subroutine temporarily clears the screen.
 Therefore, when the display condition is reestablished; for example, when measurement parameter values are changed, or when characters and patterns are displayed; they are displayed.
- See Section 1, "Screen Configuration of PTA" for the screen details.

DCH subroutine

(1) Function

Displays a character string. (Referred to at the bottom left on the screen)

(2) Format

M1 (Frame No.)	Display item
0	Waveform background
1	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
6	Display line
7	Trigger indicator
8	Marker zone
9	Template/mask standard line
10	Multi-marker No.
. 11	(Not used)
12	Marker/marker value display
13	Menu background
14	Menu characters
15	Setting and parameter characters, error message

M2	Display mode
0	Normal display
1	Reverse diaplay
	· ·

■ Range of each parameter

Font	First X coordinate (X)	First Y coordinate (Y)	Maximum No. ogf characters of string (text)
Small font	0 to 314	0 to 228	54
Medium font	0 to 312	0 to 227	40

Notes:

- The first X coordinate and Y coordinate specify the lower-left corner of the character.
- Numeric constants or numeric variables are used for X, Y, M1, and M2. "text" is a character constant or character variable.
- M2 is omissible and it is assumed to be 0 if omitted.
- The character size (small font/medium font) can be set with the DCHSIZE statement.

DCHSIZE 0: Small font

DCHSIZE 1: Medium font

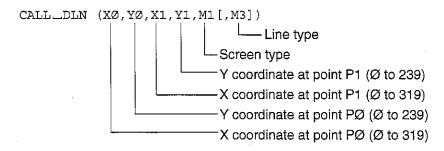

• See Section 1, "Screen Configuration of PTA" for the screen details.

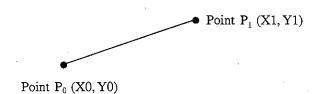

DLN subroutine

(1) Function

This subroutine displays a straight line (sectional line).

(2) Format

M1 (Frame No.)	Display item
0	Waveform background
1	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
. 6	Display line
7	Trigger indicator
8	Marker zone
9	Template/mask standard line
10	Multi-marker No.
11	(Not used)
12	Marker/marker value display
13	Menu background
. 14	Menu characters
15	Setting and parameter characters, error message

М3	Line type
0	Displays solid line
1	Erases solid line
2	Displays dashed line
3	Erases dashed line

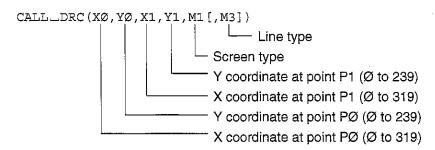

- A numeric constant or numeric variable is used for X0, Y0, X1, Y1, M1, and M3.
- M3 is omissible and it is assumed to be 0 if omitted.
- See Section 1, "Screen Configuration of PTA" for coordinate details.

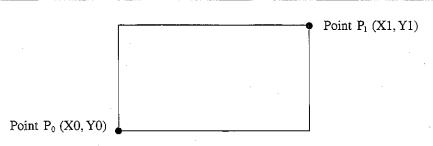

DRC subroutine

(1) Function

This subroutine displays a square based on a diagonal line between two specified points.

(2) Format

M1 (Frame No.)	Display item
0	Waveform background
1	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
6	Display line
7	Trigger indicator
8	Marker zone
9	Template/mask standard line
10	Multi-marker No.
11	(Not used)
12	Marker/marker value display
13	Menu background
14	Menu characters
15	Setting and parameter characters, error message

M3	Line type
0	Displays solid line
1	Erases solid line
2	Displays dashed line
3	Erases dashed line

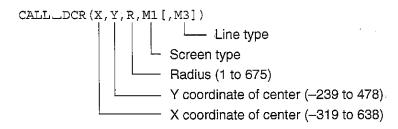

- A numeric constant or numeric variable is used for X0, Y0, X1, Y1, M1, and M3.
- M3 is omissible and it is assumed to be 0 if omitted.
- See Section 1, "Screen Configuration of PTA" for coordinate details.
- No display is performed if P0 (X0, Y0) and P1 (X1, Y1) are at the same axis.

DCR subroutine

(1) Function

This subroutine displays a circle.

(2) Format

M1 (Frame No.)	Display item
0	Waveform background
1	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
6	Display line
7	Trigger indicator
8	Marker zone
9	Template/mask standard line
10	Multi-marker No.
11	(Not used)
12	Marker/marker value display
13	Menu background
14	Menu characters
15	Setting and parameter characters, error message

	Line type
0	Displays solid line
1	Erases solid line
2	Diaplsys dashed line
3	Erases dashed line

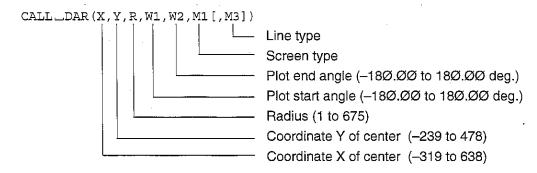

- Numeric constants or numeric variables are used for X, Y, R, M1, and M3.
- M3 is omissible and it is assumed to be 0 if omitted.
- See Section 1, "Screen Configuration of PTA" for coordinate details.

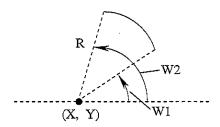

DAR subroutine

(1) Function

Displays an arc.

(2) Format

M1 (Frame No.)	Display item
0	Waveform background
1	PTA screen
2	Scale line
3	Waveform display 2
4	Waveform display 3
5	Parameter
6	Display line
7	Trigger indicator
8	Marker zone
9	Template/mask standard line
10	Multi-marker No.
11	(Not used)
12	Marker/marker value display
13	Menu background
14	Menu characters
15	Setting and parameter characters, error message

M3	Line type	
0	Displays solid line	•
1	Erases solid line	-
2	Displays dashed line	
3	Erases dashed line	

- Numeric constants or numeric variables are used for the X, Y, R, W1, W2, M1, and M3.
- M3 is omissible and it is assumed to be 0 if omitted.
- See Section 1, "Screen Configuration of PTA" for coordinate details.

DEF subroutine

(1) Function

Registers a menu label (name) in the soft key menu.

When the PTA menu (3/4) is displayed, the labels registered by this subroutine are displayed.

(2) Format

CALL_DEF (M, text)

Name of 3Ø characters maximum

Soft-key number (1 to 6)

- M is a numeric constant or numeric variable.
- "text" is a character constant or character variable.
- The labels registered by this subroutine remain valid until the PTA is turned off.

OPNI, OPNO and FDEL subroutines

(1) Function

Opens a data file to write data to and read data from a memory card and deletes an existing data file.

(2) Format

```
CALL_OPNI_character string-variable(or character constant)
Open data read
CALL_OPNO_character string-variable(or character constant)
Open data write
CALL_FDEL_character string-variable(or character constant)
Delete data file
```

- The data file name always begins with a % symbol and is followed by 6 or less alphanumeric characters including %.
- · Do not remove the memory card while opening the data file in it.
- This subroutine cannot be used with the PTA program/library files on the memory card.

DALD and DASV subroutines

(1) Function

The DALD subroutine reads data saved in the memory card, and the DASV subroutine saves data to the memory card.

(2) Format

CALL_DALD_input variable:Read data from data file
CALL_DASV_variable :Write data to data file

Notes:

- Data files are created as sequential files.
 Therefore, read them in the order in which they were written.
- Different types of data (for example, numeric type and character type) can be stored in one data file. However, when the type when the data was written and the type of input variable when the data was read cannot be assigned, an error is generated.

(3) Program example 1Ø REM "*** DATA FILE ***" Excuted result 2Ø CALL OPNO"%DATA" RES.=4Writing into file 3Ø FOR C=2 TO 1Ø RES.=9 4Ø D=C*C RES.=16 RES. = 25 50 CALL DASV D 6Ø NEXT C RES.=36 70 CALL CLS RES.=49 8Ø CALL OPNI"%DATA" RES.=64 9Ø FOR C=2 TO 1Ø RES.=81Reading from file 100 CALL DALD D RES.=100 110 PRINT "RES.=",D 12Ø NEXT C 13Ø CALL CLS 14Ø STOP

CLS subroutine

(1) Function

This subroutine closes the open data file.

Used for both write and read.

(2) Format

CALL_CLS

IFC subroutine

(1) Function

When this subroutine is executed, the GPIB port becomes the system controller and outputs an "interface clear" signal to devices connected to the GPIB bus.

(2) Format

CALL_IFC

Note: When CALL_IFC is executed from the PTA, GPIB becomes the "connection port for peripheral devices" of the conditions for interface port connection. Accordingly, if GPIB has been set as the connection port for the external controller and the printer/plotter, the "connection port for the external controller" and the "connection port for the printer/plotter" becomes "no connection (NONE)".

OPNITF, OPNOTF, FDELTF subroutines

(1) Function

Opens a text file to write and to read text data from a memory card and deletes an existing text data file. This file can be read and written as plain text file on personal computer. File attribute (.txt) is added automatically.

(2))	F	o	r	r	۲	1	a	t

CALL_OPNITF	character string-variable (or character constant)
	Open text data read
CALL_OPNOTF	character string-variable (or character constant)
	Open text data write
CALL_OPNOTF	character string-variable (or character constant)
	Delete data file

- The text data file name is followed by 6 or less alphanumeric characters.
- Do not remove the memory card while opening the next data file in it.
- This subroutine cannot be used with the PTA program/library files on the memory card.

DALDTF, DASATF subroutines

(1) Function

The DALD subroutine reads text data saved in the memory card, and the DASV subroutine saves data to the memory card.

(2) Format

CALL_DALDTF string-variable: Read data from text data file CALL_DASVTF string-variable (character constant): Write data to next data file

Notes:

- When DALDTF subroutine is executed, 1 line is read from text data file, and that is stored string-variable. If the text data is longer than variable length, the text data is cut by variable length. If string-variable is not used, an error is generated.
- When DASVTF subroutine is executed, 1 line is text data is stored to data file. If string-variable is not used, an error is generated.

(3) Program example

- 1Ø CALL OPNOTF "RWTEST"
- 2Ø FOR I=Ø TO 25
- 3Ø D\$=CHR\$ (64+I)
- 4Ø CALL DASVTF D\$
- 5Ø NEXT I
- 6Ø CALL CLSTF
- 7Ø FOR I=Ø TO 25
- 8Ø CALL DALDTF D\$
- 9Ø PRINT D\$
- 100 NEXT I
- 11Ø CALL CLSTF
- 12Ø STOP

CLSTF subroutine

(1) Function

This subroutine closes the open data file.

Used for both write and read.

(2) Format

CALL_CLSTF

RSV subroutine

(1) Function

This subroutine sends the service request to the controller when the GPIB port (the first interface) is used as a device port.

(2) Format

CALL_RSV (M)

М	PTA Event Status Register							
	MS	SB						LSB
0	×	×	×	×,	0	0	0	1
1	×	×	×	X	0	0	1	0
2	×	×	×	×	0	0	1	1
3 .	×	×	×	×	0	1	0	0
4	×	×	×	×	0	1	0	1
5	×	×	×	×	0	1	1	0
6	×	×	×	×	0	1	1	1
7	×	×	×	×	1	0	0	0
8	×	×	×	×	1	0	0	1
9	×	×	×	×	1	0	1	0
						* .		

The PTA event status register is defined as the extended status of Status-Byte bit 1.

Therefore, setting the left-described data (into the PTA Even Status Register) indirectly sets Status-Byte bit 1 as a summary bit.

The RQS bit (bit 6) is set as the logical AND of each Status-Byte bits to issue a service request to the controller.

The GPIB commands (used to read the Status Byte and PTA Event Status Register from the external controller) are *STB? and ESR1?, respectively.

(x means don't-care bit which does not change.)

- A numeric constant or numeric variable is used for M.
- This subroutine is effective only when the GPIB port is connected with the external controller (the device port mode).

TCT subroutine

(1) Function

This subroutine causes controlling right to be passed to another device provided that the GPIB port is used as a system controller port.

(2) Format

CALL_TCT(M)

Address of device to which control right is passed.

Notes:

- M is the GPIB address from 0 to 30, and a numeric constant or numeric variable is used.
- This subroutine is effective only when the GPIB port is a system controller port.

DEV subroutine

(1) Function

This subroutine causes the GPIB port to become a device port when it has previously been used as the system controller.

(2) Format

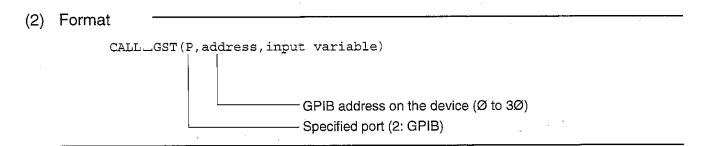

CALL_DEV

Note: When the CALL DEV subroutine is executed from PTA, the "connection port for the external controller" of the conditions for interface port connection becomes GPIB. Accordingly, if GPIB has been set as the connection port for peripheral devices and the printer/plotter, the "connection port for peripheral devices" and the "connection port for the printer/plotter" becomes "no connection (NONE)".

GST subroutine (GST)

(1) Function

When the GPIB port is set as the connection port for the external controller, a serial poll is executed to the device specified by address, and the status value is read and stored as an input variable.

- The read status value will be stored in the input variable. Input variable can be either a real-number, integer, or bit type variable.
- · This subroutine is effective only when the GPIB port is a system controller port.
- This subroutine cannot be executed on the RS-232C/parallel (centronics).

Interface control subroutine (GPIB and RS-232C)

(1) Function

The "Interface Clear" (IFC), "Remote" (REN), "Local" (LCL), "Device Clear" (DCL), "Local Rockout" (LLO), and "Device Trigger" (DTR) are sent, and "Return to Local" (RTL) is set from the specified port.

Format

CALL_GPIB(P,Ø)	Sends IFC
CALL_GPIB(P,1[,address])	Sends REN
CALL_GPIB(P,2)	Sends RTL
CALL_GPIB(P,3[,address])	Sends LCL
CALL_GPIB(P,4[,address])	Sends DCL
CALL_GPIB(P,5)	Sends LLO
CALL_GPIB(P,6,address)	Sends DTR
P: Specified port No. (RS-232C: 1, GPIB: 2,	, Parallel (centronics): 3)

Address: GPIB device address of Ø to 3Ø

Notes:

- P and address are numeric constants or numeric variables.
- The actions of each subroutine are described below.

IFC:

- The IFC line is turned on for 100 É sec. The interface functions of all connected devices are initialized.
- Initialization is executed only for the corresponding interface functions. This code does not affect device functions.
- All talkers and listeners are not released.
- This does not affect the SRO line.
- If the system passes control of the GPIB port to other controllers with the CALL TCT (m) command, control will be automatically returned to the PTA when execution is finished.
- This subroutine terminates normally without performing any processing for the RS-232C.

REN:

- When [, address] is omitted, the REN line is turned ON. Afterwards when the device is set to listener, it will assume remote control status.
- · When [, address] is specified, the REN line is turned on. The device specified by [, address] will be identified as the listener and assume remote control status.
- Can be executed only when the specified port is a system controller port.
- This subroutine terminates normally without performing any processing for the RS-232C.

Notes: (Continued)

RTL:

- When the GPIB port is identified as the device, the PTA assumes the local control status. (This has the same effect as pressing the [LOCAL] key.)
- Only "2" can be specified as the port No.

LCL:

- When [, address] is omitted, the REN line is turned off. All devices assume local control status.
- When [, address] is specified, all listeners are released. After that, the device specified by [, address] is selected as the listener and assumes local control status. The REN line does not change.
- Can be executed only when the specified port is a system controller port.

DCL:

- When [, address] is omitted, "DCL" is sent and all device functions on the GPIB are initialized.
- When [, address] is specified, (Selected Device Clear) is sent and the device function specified by [, address] is initialized.
- Can be executed only when the specified port is a system controller port.

LLO:

- Disables the remote to local switching function of all devices on the GPIB. You will not be able to switch the device to local with the [Local] key on the panel.
- Switching is possible with the REN and LCL commands from the PTA.
- This mode can be exited with the LCL command in which the [, address] is omitted.
- Can be executed only when the specified port is a system controller port.

DTR:

- Triggers the specified device. The specified device begins the predetermined operation.
- Can be executed only when the specified port is a system controller port.
- This subroutine terminates normally without performing any processing for the RS-232C.

PNLU and PNLL subroutine

(1) Function

Sets LOCK/UNLOCK of the front panel when PTA is on.

(2) Format

CALL_PNLU(Ø)

unlocks front panel.

CALL_PNLL(Ø)

Locks front panel.

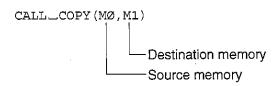

Note: The front-panel soft keys [F1] to [F6], [Shift], [Local] ,and numeric keys cannot be lock-out.

COPY subroutine

(1) Function

This subroutine copies the data in a specified waveform memory (copy source) to another waveform memory (copy destination). For example, use of the sub memory permits measurement in parallel with data processing.

(2) Format

M0, M1	Memory	System variable name	Туре
0	Measurement memory	XMA ()	Integer (0.01 dBm unit)
1	Measurement memory	XMB ()	Integer (0.01 dBm unit)
2	Submemory a	SMA()	Integer (0.01 dBm unit)
3	Submemory b	SMB()	Integer (0.01 dBm unit)
4	Image memory a	IMA()	Integer
5	Image memory b	IMB ()	Integer
6	Real number memory a	RMA()	Real number
7	Real number memory b	RMB ()	Real number
8	Measurement memory	XMT ()	Integer
9	Measurement memory	XMB ()	Integer
10	Sub memory	SMT()	Integer
		•	

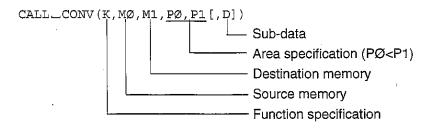

- M0 contents are copied in M1. M0 contents are not changed. Previous contents of M1 are lost.
- A numeric constant or numeric variable is used for M0 and M1.
- Data cannot be copied between integer memory and real number memory.

CONV subroutine

(1) Function

This subroutine converts the measurement data of the measurement memory and performs the operation between memories.

(2) Format

К	. ,		Conversion (operation) function
0	Integer (0.01 dBm) →	
1	Real nun	nber (dBm) \rightarrow	Integer (0.01 dBm)
2	Integer (0.01 dBm) →	Real number (mW) M1 (x)=10 \uparrow (M0 (x)/1000)
3	Real nur	nber (mW) →	Integer (0.01 dBm) M1 (x)=INT (1000*LOG ₁₀ (M0 (x)))
4	ADD	M1=M0+D	
5	SUB	M1=M0-D	
6	MUL	M1=M0*D	
7	DIV	M1=M0/D	
8	ADDA	M1=M1+M0+	-D
9	SUBA	M1=M1-M0+	$-D n + \frac{D-1}{2}$
10		g average (runnir d number)	ag average every D points, M1 (n)= $\frac{1}{D} \sum_{k=n-\frac{D-1}{2}}^{2} M0 (k)$

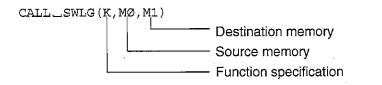

- When K is assumed to be 0 to 3, use the memory number 0 to 5, 8 or 9 for the memory called "integer", and use the memory number 6 or 7 for the memory called "real number".
- P0 and P1 are numeric constants or numeric variables from 0 to 500.
- D is a numeric constant or numeric variable. Its default is D=0.
- When K is 10, $(P0-\frac{D-1}{2}) \ge 0$ and $(P1+\frac{D-1}{2}) \le 500$ must be satisfied.

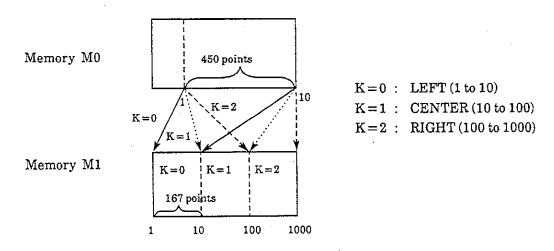

SWLG subroutine

(1) Function

This subroutine arranges the data of the specified memory so that the frequency axis is LOG display and then transfers it.

(2) Format

The memory M0 data is a measured value obtained by an ordinary (linear) sweep.

The frequency axis LOG for 3 decades can be displayed in memory M1 by sweeping three times by changing the frequency and by executing the SWLG subroutine three times.

Note: The M0 and M1 must be combined within the integer memories, or real M0 and M1 must be combined in the real number memories.

System Functions

The system functions can extract and calculate special points in the waveform data, with the waveform memory as the objective. Therefore, there is a function result value.

System function		Function	
Maximum value	MAX(M, P0, P1 N)	Returns the maximum value between P0 to P1	
Minimum value	MIN(M, P0, P1, N)	Returns the minimum value between P0 to P1	
Frequency at specified measured value (1)	BNDL(M, P0, L, N)	Starts search from P0 and returns the frequency of the supecified measured value	
Frequency at specified measured value (2)	BNDH(M, P0, L, N)	Starts search from P0 and returns the frequency at the supecified measured value	
Frequency at specified measured value (3)	MESL(M, P0, L, N)	Starts search from P0 and returns the frequency of the supecified measured value	
Frequency at specified measured value (4)	MESH(M, P0, L, N)	Starts search from P0 and returns the frequency of the supecified measured value	
Ripple 1	RPL1(P0, P1, N [, R])	Obtains ripple 1 between P0 to P1	
Ripple 2	RPL2(P0, P1, N [, R])	Obtains ripple 2 between P0 to P1	
Ripple 3	RPL3(P0, P1, N [, R])	Obtains ripple 3 between P0 to P1	
Peak 1	PEKL(M, P0, L, N [, R])	Starts search from P0 and returns peak value	
Peak 2	PEKH(M, P0, L, N [, R])	Starts search from PO and returns peak value	
Pole 1	POLL(M, P0, L, N [, R])	Starts search from P0 and returns pole (dip) value	
Pole 2	POLH(M, P0, L, N [, R])	Starts search from P0 and returns pole (dip) value	
Inflection top value 1	PLRH(M, P0, N [, R])	Starts search from P0 and returns adjacent inflection maximum	
Inflection top value 2	PLLH(M, P0, N [, R])	Starts search from P0 and returns adjacent inflection maximum	
Inflection bottom value 1	PLRL(M, P0, N [, R])	Starts search from P0 and returns adjacent inflection minimum	
Inflection bottom value 2	PLLL(M, P0, N [, R])	Starts search from P0 and returns adjacent inflection minimum	

(Continued)

Sy	stem function	Function
Frequency specified point	PFRQ(P0)	Returns frequency of P0 point
Total	SUM(P0, P1, N)	Returns total of the memory contents between P0 to P1
Addition search 1	PSML(M, P0, L, N)	Successively adds from P0 and returns a point with the specified value
Addition search 2	PSMH(M, P0, L, N)	Successively adds from P0 and returns a point with the specified value
Decision 1	DPOS(M, P0, P1, N1, N2)	Compares and decides the size of the memory contents
Decision 2	DNEG(M, P0, P1, N1, N2)	Compares and decides the size of the memory contents

- Since the waveform memory is the objective of the system functions, the input values (P0 and P1) to each function are specified as points on all the waveform memories.
- P0, P1, L, N and R are input parameters indicated by a numeric constant or numeric variable.
- M is an output parameter indicated by a variable.
- N, N1 and N2 are parameter which specify the waveform memory. It is a numeric constant or numeric variable.

N, N1, N2	Memory	System variable name	Туре
0	Measurement memory TRACE-A	XMA ()	Integer
1	Measurement memory TRACE-B	XMB ()	Integer
2	Submemory a	SMA()	Integer
3	Submemory b	SMB()	Integer
4	Image memory a	IMA ()	Integer
5	Image memory b	IMB ()	Integer
6	Real number memory a	RMA()	Real number
7	Real number memory b	RMB ()	Real number
8	Measurement memory TRACE-TIME	XMT ()	Integer
. 9	Measurement memory TRACE-BG	XMG()	Integer
10	Sub-memory t	SMG()	Integer

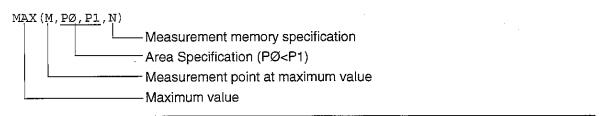

- [,R] can be omitted. When omitted, R is assumed to be 0.
- P0 and P1 specify the points in the waveform memory. Their setting range is 0 to 1001.
- P0 and P1 used in the system functions always specify the points in the measurement memories.

MAX function

(1) Function

This function obtains the maximum value in the specified measurement memory area and the measurement point at the maximum value.

(2) Format

Note: If there is more than one point with the same maximum value, the first point of the maximum value is stored in M.

- (3) Program example: Obtains maximum level in measurement memory TRACE-A.
 - 10 REM "MAX(M,P0,P1,N)"
 - 2Ø GMAX=MAX(M,Ø,5ØØ,Ø)
 - 3Ø GMAX=GMAX*Ø.Øl
 - 4Ø PRINT "Maximum Level=",GMAX,"dBm"
 - 5Ø STOP

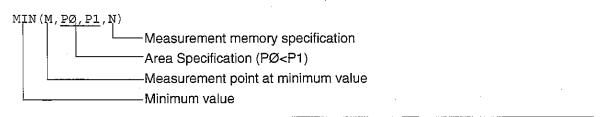

Maximum Level=-20.45dBm

MIN function

(1) Function

This function obtain the minimum value in the specified measurement memory area and the measurement point at the minimum value.

(2) Format

Note: If there is more than one point with the same minimum value, the first minimum value point is stored in M.

- (3) Program example: Obtains minimum level in measurement memory TRACE-B.
 - 10 GMIN=MIN(M, \emptyset ,500,1)
 - 20 GMIN=GMIN*0.01
 - 3Ø PRINT "Min Level=", GMIN, "dBm at", M
 - 4Ø STOP

BNDL, BNDH, MESL, and MESH functions

(1) Function

These functions obtain the frequency at the specified measured value by searching from a starting point in the specified memory.

(2) Format

BNDL (M, PØ, L, N)

BNDH (M, PØ, L, N)

MESL (M, PØ, L, N)

MESH (M, PØ, L, N)

Measurement memory specification

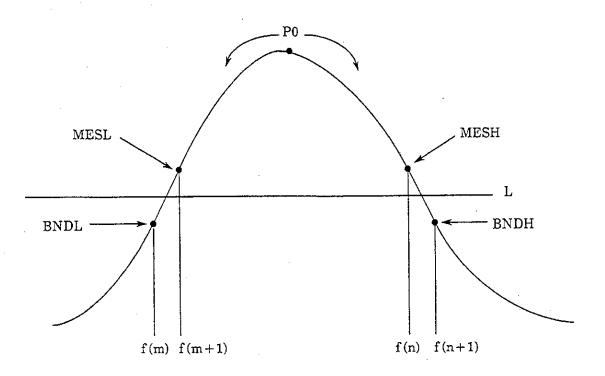

Specified measured value

Search starting point

Measurement point at specified measured value

Frequency (or time) at specified measured value

- When N is specified to 0, 2, 4, 6, 7
 Find the frequency of the specified measurement value from the TRACE-A setting frequency.
- When N is specified to 1, 3, 5, 7
 Find the frequency of the specified measurement value from the TRACE-B setting frequency.
- When N is specified to 8, 10
 Find the time of the specified measurement value from the TRACE-TIME setting time.
- When N is specified to 9
 Find the frequency of the specified measurement value from the TRACE-BG setting time.

Note: If there is no specified measured value in BNDL and MESL, M is assumed to be 0; in BNDH and MESH, M is assumed to be 1001.

- (3) Program example: Obtains bandwidth at level of -20 dBm in A channel memory, searching from center.
 - 10 L=-2000 indicates -20 dBm
 - 2Ø FL=BNDL(ML,25Ø,L,Ø)
 - $3\emptyset$ FH=BNDH(MH,25 \emptyset ,L, \emptyset)
 - 4Ø BW=(FH-FL)/1ØØØ
 - 5Ø PRINT "BW=", BW, "KHz"
 - 6Ø STOP

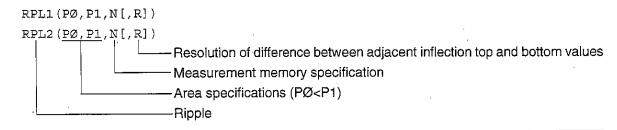

RPL1 and RPL2 functions

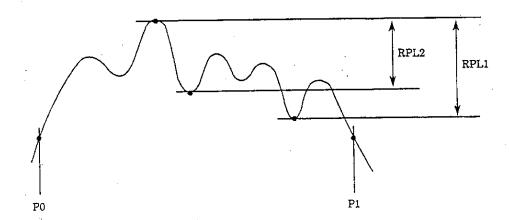

(1) Function

These functions obtain ripple 1, and 2 in the specified memory area.

- Ripple 1: This is the difference between the maximum value of the inflection top value and the minimum value of the inflection bottom value.
- Ripple 2: This is the maximum difference between the adjacent inflection top and bottom values.

(2) Format

- If the difference between the adjacent inflection top and bottom values is smaller than R, the ripple is not obtained.
- N which specifies the measured memory must be from 0 to 5, 8 or 9. (No real number memory can be used.)
- (3) Program example: Obtains Ripple 1 between the measurement points 100 and 300 in measurement memory TRACE-A, where resolution is 0.2 dB.

 - 2Ø RP=RP/1ØØ
 - 3Ø PRINT "RPL1=",RP, "dB"
 - 4Ø STOP

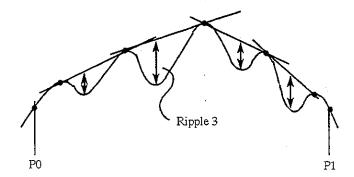

RPL3 function

(1) Function

This function obtains the maximum difference between the adjacent tangent at the inflection top and inflection bottom value (ripple 3) in the specified memory area as shown a figure below.

(2) Format

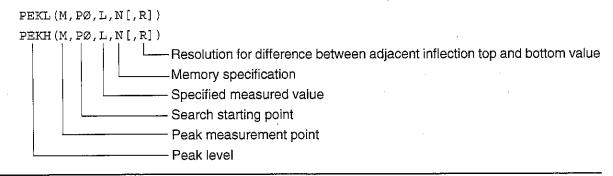

- If the difference between the adjacent inflection top and bottom values is smaller than R, the ripple is not obtained.
- N which specifies the measured memory must be from 0 to 5, 8 or 9. (No real number memory can be used.)
- (3) Program example: Obtains Ripple 3 between the measurement points 50 and 450 in the measurement memory TRACE-B, where resolution is 0.1 dB.
 - 1Ø RP=RPL3 (5Ø, 45Ø, 1, 1Ø,)
 - 2Ø RP=RP/1ØØ
 - 3Ø PRINT "RPL3=",RP,"dB"
 - 4Ø STOP

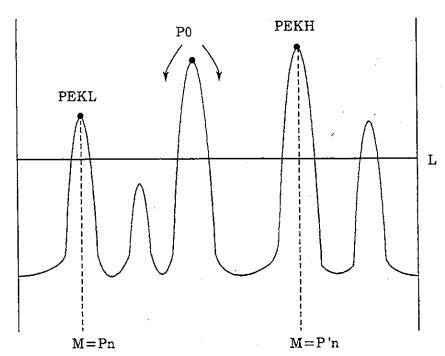

PEKL and PEKH functions

(1) Function

These functions find the first peak and its measured point, which is larger than the specified measured value in the measurement area, by searching from a starting point in the specified memory.

(2) Format

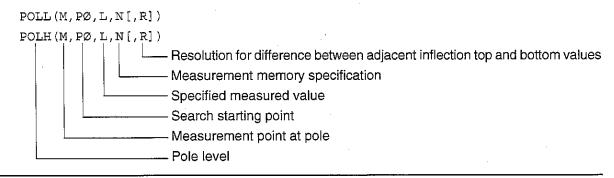

- If the peak cannot be found with the PEKL function, M is assumed to be 0, and the measured value at point 0 is PEKL.
- If the peak cannot be found with the PEKH function, M is assumed to be 500, and the measured value at point 1001 is PEKH.
- N which specifies the measured memory must be from 0 to 5, 8 or 9. (The real number memory cannot be used.)
- If the difference between adjacent inflection top and bottom values is smaller than R, the inflection top is not the peak.
- (3) Program example: Obtains peak level higher than -50 dBm searched left of the measurement point 200 in measurement memory TRACE-A, where resolution is 2 dB.
 - 1Ø PLEV=PEKL(M,2ØØ,-5ØØØ,Ø,2ØØ)
 - 2Ø PLEV=PLEV/1ØØ
 - 30 PRINT "Peak Level=", PLEV, "dBm at", M
 - 4Ø STOP

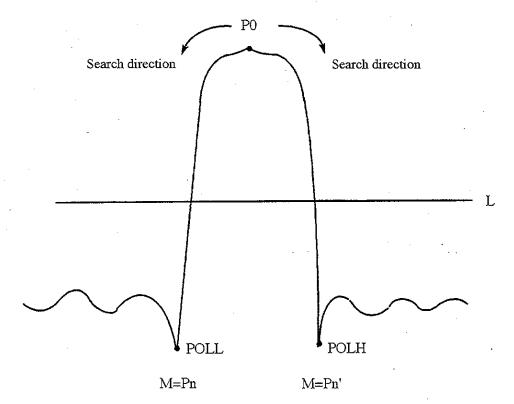

POLL and POLH functions

(1) Function

These functions obtain the pole and its measurement point, which is smaller than the specified measured value in the measurement area, by searching from a starting point in the specified memory.

(2) Format

- If pole cannot be obtained in POLL function, M is assumed to be 0, and the measured value at point 0 is POLL.
- If pole cannot be obtained in POLH function, M is assumed to be 1001, and the measured value at point 500 is POLH
- N which specifies the measured memory must be from 0 to 7, 8 or 9. (No real number memory can be used.)
- If the difference between adjacent inflection top and bottom values is smaller than R, the inflection top is not the pole.
- (3) Program example: Obtains pole level lower than -60 dBm searched left of the measurement point 250 in measurement memory TRACE-A, where resolution is 1 dB.

```
1Ø PL=POLL (M, 25Ø, -6ØØØ, Ø, 1ØØ)
```

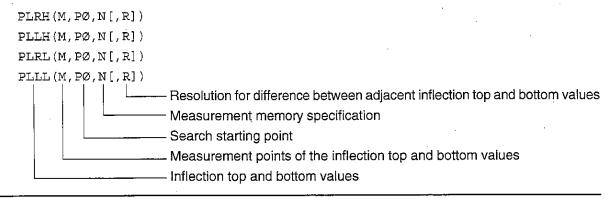

- 2Ø PL=PL/1ØØ
- 30 PRINT "Poll Level=", PL, "dBm at", M
- 4Ø STOP

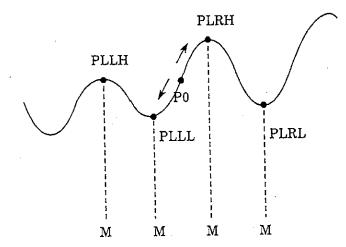

PLRH, PLLH, PLRL and PLLL functions

(1) Function

These functions obtain the first inflection top and bottom values and their measurement points by searching from a starting point in the specified memory.

(2) Format

- If the difference between the adjacent inflection top and bottom values is smaller than R, the two points are not the inflection points. If R is omitted, it is assumed to be 0.
- If there is no inflection top and bottom point, M is assumed to be 0 at PLLH and PLLL and M is assumed to be 1001 at PLRH and PLRL; the measured value at point 0 is PLLH and PLLL and that at point 1001 is PLRH and PLRL.
- N specified by measured memory must be from 0 to 7, 8 or 9. (No real number memory can be used.)

- (3) Program example: Obtains inflection top level searched right of the measurement point 200 in measurement memory TRACE-B, where resolution is 3 dB.
 - 1Ø PL=PLRH(M,25Ø,1,3ØØ)
 - 2Ø PL=PL/1ØØ
 - 30 PRINT "Peak Level=",PL,"dBm at",M
 - 40 STOP

PFRQ function

Function

This function finds the frequency of the specified point or time in the memory.

(2) Format

PFRQ (PØ)
Specified point

Notes:

- When the effective trace setting on the CRT is frequency domain (TRACE-A, B, BG), the frequency is output; and when it is time domain (TRACE-TIME) the time is output.
- Frequency is output in 1 Hz units and time is output in 1µs units.
- This function finds frequency values by the following equations:

Frequency=start frequency+ $\frac{P0}{500}$ *(frequency span)

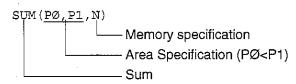

- (3) Program example: Obtains maximum level between the measurement points 100 and 300 and frequency at that point in the measurement memory TRACE-A.
 - 1Ø GMAX=MAX(M,1ØØ,3ØØ,Ø)
 - 2Ø FR=PFRQ(M)
 - 3Ø GMAX=GMAX/1ØØ
 - 4Ø FR=FR/1E6
 - 5Ø PRINT "Peak Freq=",FR,"MHz"
 - 6Ø PRINT "Peak Level=", GMAX, "dBm"
 - 7Ø STOP

SUM function

(1) Function

This function finds the sum of the memory contents of a certain interval in the specified memory.

(2) Format

$$SUM = \sum_{k=P0}^{P1} L(k)$$

- (3) Program example: Obtains average value between the measurement points 240 and 260 (21 points) in measurement memory TRACE-A.
 - 10 S=SUM(240,260,0)
 - 2Ø AV=S/21/1ØØ
 - 3Ø PRINT "Average=", AV:F7.2, "dBm"
 - 4Ø STOP

Note: When the measurement memory contains invalid data (points with marker level displayed as ***), that data is assumed to be -30000 (=-300.00 dBm) and calculation is performed.

PSML and PSMH functions

(1) Function

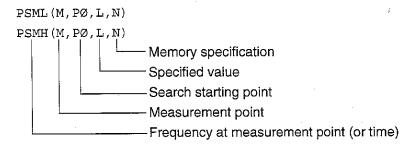

This function finds the point where the sum equals or exceeds the specified value while adding the memory contents sequentially by searching from a starting point in the specified memory.

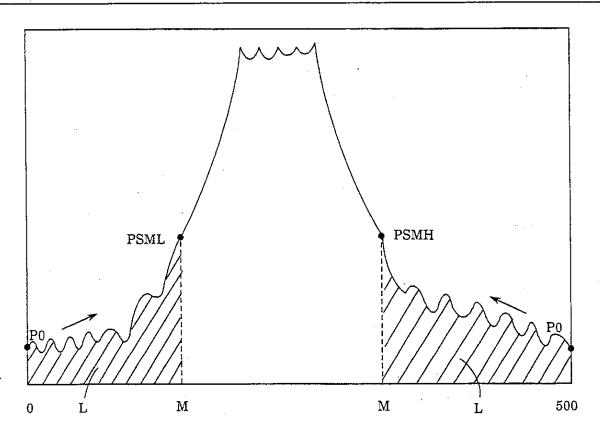

(For example, this is used to measure the occupied bandwidth)

Finding method of the frequency or time depends on the specified waveform memory number.

See Section 5, "BNDL, BNDH, MESL and MESH functions" for details.

(2) Format

PSML: Finds the minimum value of M that satisfies

$$L \le \sum_{k=P0}^{M} L(k)$$

PSMH: Finds the maximum value of M that satisfies

$$L \leq \sum_{k=M}^{P0} L(k)$$

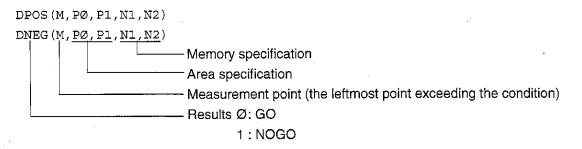

- (3) Program example: Converts the measurement data in measurement memory TRACE-A to real value of mW unit, obtains sum of total data and frequency of the point, where sum equals 0.5% of the total sum adding the memory contents by searching from left end (address 0).
 - 10 CALL CONV(2,0,6,0,500)
 - 2Ø T=SUM(Ø,5ØØ,6)
 - 3Ø L=T*Ø.ØØ5
 - 4Ø FR=PSML(M,Ø,L,6)
 - 50 FR=FR/1E6
 - 60 PRINT "Point=",M
 - 7Ø PRINT "Freq=",FR,"MHz"
 - 8Ø STOP

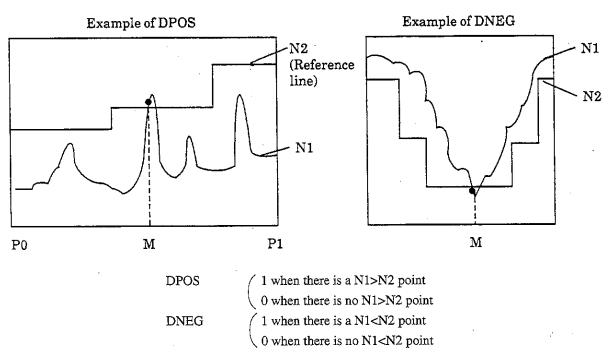

DPOS and DNEG functions

(1) Function

These functions compare the contents of two memories by address. If a value in one memory is larger (or smaller) that the other even if at only one point, the function value is assumed to be 1. Otherwise, 0 is output. (For example, this is used to judge GO/NOGO for the standard.)

(2) Format

- (3) Program example: Compares the measurement data in measurement memory TRACE-A with measurement data in measurement memory TRACE-B and displays GO or NOGO.
 - 1Ø X=DPOS(M,Ø,5ØØ,Ø,1)
 - 2Ø IF X=Ø PRINT "GO"
 - 3Ø IF X=1 PRINT "NO GO"
 - 4Ø STOP

SECTION 6

REMOTE CONTROL COMMANDS USED WITH PTA PROGRAM/LIBRARY

TABLE OF CONTENTS

Outline	6-3
PTA Dedicated Remote Control Commands	6-4

SECTION 6 REMOTE CONTROL COMMANDS USED WITH PTA PROGRAM/LIBRARY

Outline

Remote control commands to control the main frame side, using PUT and WRITE 1000 texts in a PTA program/ library, are sent. Also, using GET, COM and READ 1000 texts, measurement parameters and measurement results of the main frame side are read out. Remote control commands available here include all control and inquiry commands defined on the MS2665C/67C/68C main frame side. In addition, there are also remote control commands specially prepared for PTA programs/libraries.

PTA Dedicated Remote Control Commands

When setting or reading parameters of a measuring instrument on the PTA main frame side, messages in the remote control command format are sent using the WRITE 1000 or READ 1000 statement.

In PTA, besides the remote control commands of MS2665C/67C/68C, the following messages can be sent out.

Function		Message
Port Switching	Control PORT_1	; Selects RS-232C as the PTA control port.
	PORT_2	; Selects GPIB as the PTA control port.
	PORT_3	; Selects the parallel (centronics) as the PTA controller port.
	Request PORT?	; Requests the PTA control port.
Event Occurrence DELAY	Control EDLY_t	; Sets the DELAY time an event interrupt will occur.
(Clock 1)	<u>l</u>	DELAY time: 1 seconds up to 1 hour (in 1 s step)
Event Occurrence TIME (Clock 2)	Control ETIM_t1,t2,t	; Sets the time an event interrupt will occur Seconds: Up to 59 seconds Minutes: Up to 59 minutes Hours: Up to 23 hours
Event Occurrence CYCLE (Clock 3)	Control ECYC_t	; Sets the cycles an event interrupt will occur. Cycle: 1 seconds up to 1 hour (in 0.1 s steps)

- For details on the WRITE 1000 and READ 1000 statements, see Section 4, "Setting measurement parameters (PUT and WRITE 1000 statements)" and "Measurement parameter/ data read (GET, COM and READ 1000 statements)".
- · For details on event interrupts, see Section 4, "ENABLE EVENT statement".
- The control port (for the WRITE, READ, LISTG statements and other GPIB statements supported by the PTA) is the port selected by the PORT command except when these statements are executed with a direct port specification.
 - In the initial state, the GPIB1 port is selected as the PTA control port.
- Ports specified by the port switching command are not initialized by PTA→OFF.

SECTION 7 EXTERNAL INTERFACE IN PTA

Outline

MS2665C/67C/68C provides an RS-232C interface and a GPIB interface as standard, and a parallel (centronics) interface (option 10) is optionally available. These external interfaces can be controlled from PTA.

Selection of Controlled Interface Port from PTA

An interface port controlled from PTA is selected by the "connection port for peripheral devices (Connect to Peripheral)" of the Interface menu.

- (1) Press [SHIFT] + [::Interface] keys.
- (2) Press the F6 key "connection port for peripheral devices (Connect to Peripheral)" several times to display candidate interface ports for selection.

If the interface port to be controlled from PTA has been set as the "connection port for the external controller (Connect to Controller)" or the "connection port for the printer/plotter (Connect to Printer/Plotter)", first switch the selection to another port or make it "no connection (NONE)" and then operate the F6 key "connection port for peripheral devices (Connect to Peripheral)".

Also, using the PORT remote command or CALL IFC subroutine, it is possible to make the external interface port forcibly controllable from PTA.

- PORT_1: This command forcibly sets the connection port for external devices as the RS-232C interface.
- PORT_2: This command forcibly sets the connection port for external devices as the GPIB interface.
- PORT_3: This command forcibly sets the connection port for external devices as the parallel (centronics) interface.
- CALL IFC: This command forcibly sets the connection port for external devices as the GPIB interface.

RS-232C Functions in PTA

(1) Program listing

The LISTG command lists programs from the RS-232C port to an external printer.

(2) Data sending

The WRITE statement sends data to a device connected to the RS-232C.

WRITE_M, Variable[:Format][, Variable[:Format] · · · ·]

Output data (A character constants available.)

External device address (numeric constant or variable used.)

(3) Data receiving

The READ statement receives data from a device connected to the RS-232C.

READ_M, Variable [, Variable · · · ·]

Received data is input in the variable.

External device address (numeric constant or variable used.)

(4) Time-out

The time-out time is input as five seconds (initial value).

Use the following GPIB command to change the time-out time:

TOUT_t t=0 to 255 seconds (second unit)

If t=0 is specified, no time-out is set.

(5) Terminating Codes for READ/WRITE Statements

The following terminating codes are used for the RS-232C port.

Send terminators

<port> command</port>	Terminator code
WRITE	Either CR+LF or LF
LISTG	(Comply with TRM command)

Receive terminators

<port> command</port>	Terminator code
READ	LF or CR + LF

GPIB Functions in PTA

Function as controller

When the GPIB interface port is set as the "connection port for peripheral devices (Connect to Peripheral)", GPIB functions as a controller.

(1) Program listing

Lists programs to an external printer by using the LISTG command through the current GPIB port.

(2) IFC sending

Sends the "Interface Clear" to the device on the GPIB by using the CALL_IFC statement.

(3) Controller right allocation

Allocates controller right to the device with the address specified by M by using the CALL_TCT (M) statement.

(4) Data sending

Sends the data to the device on the GPIB by using the WRITE statement

WRITE_M, Variable[:Format] [, Variable[:Format]...]

Output data (A character constant is possible.)

Address of external device (A numeric constant or numeric variable is used.)

NOTES

When M is 1000, the functions of the MS2665C/67C/68C main frame are set. Also, this operations are performed in either the controller or device mode at this time.

(5) Data reception

Receives the data from the device on the GPIB by using the READ statement

READ_M, Variable [, Variable...]

Received data is input in variable.

Address of external device (A numeric constant or numeric variable is used.)

NOTES

When the specified GPIB port is the device port, WRITE and READ statements access the dual-port memory.

NOTES

When one- or two-digit value (e.g.,5 or 17) is specified for an address, the value indicates the address of the device connected to the port specified by the PORT command of the GPIB command (Indirect Port Specification). When a three-digit value (e.g.,105 or 217) is specified, the high-order digit indicates the port number, and two low-order digits indicate the address of the device connected to the port indicated by the above port number. (Direct Port Specification).

The two lower digits of an address at indirect or direct port specification have no meaning in RS-232C. However, these digits should still be specified for form's sake.

Example:

WRITE_5, "ABC"	Data is sent to address 5 through the current port (indirect port
	specification).
WRITE_1Ø5,"ABC"	Data is sent to address 5 through the specified port No.1
	(RS-232C) (direct port specification).
READ_217,A\$	Data is input from address 17 through the specified port No.2
	(GPIB) (direct port specification).

These address specifications are effective for the WRITE, BWRITE, WWRITE, READ, BREAD, WREAD and LISTG statements.

The relationship (between the port specification command and controller port) is as follows:

	Indirect port specification	Direct port specification	
	WRITE 5	WRITE 1Ø5	WRITE 2Ø5
At power-on or after "PORT_1" execution	*1 The RS-232C port is the controller port.	*1 The RS-232C port is the controller port.	*2 The GPIB port is the controller port.
A C. HIDODET OH	*2	*1	*2
After "PORT_2" execution	The GPIB port is the controller port.	The RS-232C port is the controller port.	The GPIB port is the controller port.

- *1 Address specification in the RS-232C has no meaning. However, the address should still be specified for form's sake.
- *2 If the GPIB port is not the controller port due to the CALL IFC statement, it controls the dual port memory. In this case, the LISTG statement becomes ineffective.

When the specified port is a device port, data is written to and read from the dual port memory. In this case, the BWRITE, WWRITE, BREAD, WREAD, and LISTG statements cannot be used.

(6) Time out

The time-out value is 30 s (initial value).

The following GPIB command is used for change of thime-out value.

GTOUT_t
$$t=0$$
 to 225 s (in 1 s steps)

When t=0 is specified, no time-out is set.

(7) Terminating Codes for READ/WRITE Statements

The following terminating codes are used for the GPIB ports.

Talker (send) terminators

<port></port>	Terminator code
<gpib> WRITE LISTG</gpib>	Depends on TRM command. eiter CR + LF or LF

Listener (receive) terminators

<port></port>	Terminator code
<gpib> READ</gpib>	LF or CR + LF

Note:

The TRM command shown below is a GPIB command.

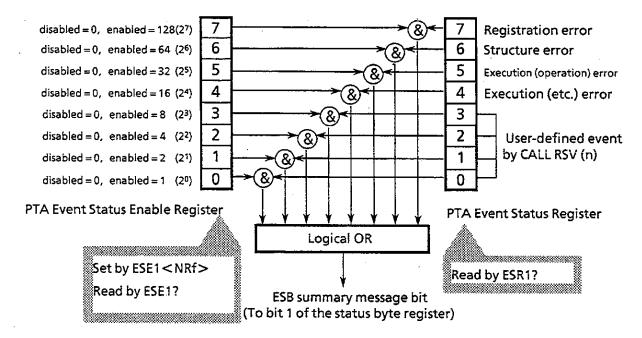

TRM_1 (CR + LF) |
TRM_Ø (LF only) |
Initial value : LF only

Function as device

When the GPIB interface port is set as the "connection port for the external controller (Connect to Controller)", GPIB functions as a device.

(1) Service request sending

Sends a service request command to an external controller by using the CALL_RSV (M) statement.

Bit	Event name	Description
7	Registration error	Error at program registration
6	Structure error	Error on program structure
5	Execution (operation) error	Error at operation on program execution
4	Execution (etc.) error	Error at other than program operation
3	(User-defined event)	(User defined by CALL RSV (n))
2	(User-defined event)	(User defined by CALL RSV (n))
1	(User-defined event)	(User defined by CALL REV (n))
0	(User-defined event)	(User defined by CALL RSV (n))

Functions of Parallel (centronics) in PTA

(1) Program listing

The LISTG command lists programs from the parallel (centronics) port to the external printer.

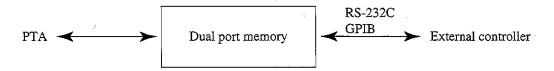

Dual Port Memory

(1) Application and configuration

The dual port memory is built in PTA, and data can be freely written and read from PTA and the external controller.

Data and measurement results obtained in the PTA program/library are outputted to the external controller through this memory, and used for performing communication between PTA and external controller.

The external controller writes to and reads from the dual port memory through the interface set as the "connection port for the external controller (Connect to Controller)".

The dual port memory consists of thirty-two 32-byte memories. The memories are accessed by specifying the memory number.

Memory numbers from 0 to 31 can be specified.

Dual port memory configuration

Memory No. 0	32 bytes
Memory No. 1	32 bytes
Memory No. 2	32 bytes
• • •	:
Memory No. 30	32 bytes
Memory No. 31	32 bytes

(2) Writing data to dual port memory

Format

Writing from PTA

WDPM memory number, write data or PUT(or WRITE 1000) " PMY memory number, write data"

- Writing from external controller
 - " PMY memory number, write data"
- When writing data to the dual port memory, be sure to specify the memory number. Data is written sequentially, beginning from the first byte of the specified memory number.
- A 1-byte termination code (LF) is added at the end of the write data.
- When the write data size exceeds 32 bytes, it can be written to the next memory. When the write data size is exactly 32 bytes, the termination code is stored at the beginning of the next memory. However, when data has been written up to the last byte of the last memory number, the termination code is not added.
- When writing past the last byte of the last memory number is attempted, an error is generated and writing is not performed. In this case, the previously written data is retained.
- Data is always stored in memory as ASCII data. When data is written from the PTA, its storage size differs as follows, depending on the type of data:

1) Character constant/variable

- Written as 1 byte/1 character ASCII data.
- When unformatted character variable data is written, (number of bytes of array size)+(1 byte: space code) is written. The termination code is written at the end.
- When upper case formatted character variables are used, a 1-byte space code is written at the end of the
 data. The termination code is written at the end.
- When character variables are used, the number of characters in " " are written. The termination code is written at the end.

2) Numeric variable

Numerics are converted to character strings (ASCII data) and data of that size is written.
 The minus sign and decimal point require one byte each.
 The termination code is written last.

3) Bit variable

- The 0/1 numeric of each bit is converted to a character string (ASCII data) and data of that size is written as 1 byte/1 bit.
- The storage format when the data is formatted/unformatted is the same as when character variables are
 used.
- The BWRITE and WWRITE statements cannot be used.

Examples:

Writing from PTA

WDPM Ø, "MEASEND"

: Write "MEASEND" to Memory No. 0.

Writing from external controller

"PMY Ø, MEASSTART"

: Write "MEASSTART" to memory No.0.

Notes:

- The WDPM statement is a dedicated statement for writing data to dual port memory.
- The PUT or WRITE 1000 statement is mainly used to set measurement parameters of the main frame.
 However, messages in the same format as setting from the external controller can be written using these commands by sending messages in the remote control command format from PTA.

(3) Reading data from dual port memory

Format

Reading from PTA

RDPM memory number, input variable[,input variable..] or PUT(or WRITE 1000) "PMY? read start memory number, number of memories" +READ 1000, input variable[,input variable]

· Reading from external controller

"PMY? read start memory number, number of memories" + read command

• When reading data from the dual port memory, be sure to specify the memory number. Everything up to the termination code (LF) is, as a rule, output as one data item.

However, when dual port memory was read up to the last byte of the last memory number, the data is assumed to end at that point.

- When data was written over multiple memories and is read by specifying an intermediate memory number, the intermediate data is read.
- As a rule, when data is read from the PTA, the data up to the termination code is read. However, if the data contains commas (", "), the commas are assumed to be delimiters and the data up to the front of the comma is stored in the input variable. Therefore, in this case, multiple input variables must be specified.

When the number of delimited data and the number of input variables is different, a write error (when the number of input variables is large) may be generated, or the output data may remain inside (when the number of input variables is small).

To avoid a comma being considered a data delimiter, store the data up to the termination code in one input variable by specifying ";" at the end of the statement.

In this case, only one input variable can be specified.

- When data is read from an external controller and when data is read from the PTA with the PUT or WRITE 1000 statement, use the "PMY?" command. The "PMY?" command can specify the read start memory number and the number of memories to be read. In this case, the data from the beginning to the termination code of each memory number is delimited into the specified number of memories by commas and is output.
- When the data in the dual port memory is assigned to input variables, it may not be possible to assign the data to an input variable type different from the assignment data. In this case, a read error is generated.
- · The BREAD and WREAD statements cannot be used.

Examples:

Reading from PTA

RDPM Ø, A\$

: Read data from Memory No. 0 and store it in character

variable A\$.

Reading from external controller

"PMY? Ø, 3"

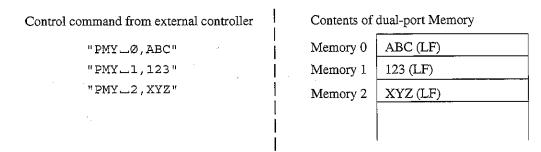

: Issue a memory data output request for Nos. 0 to 3 (memory

Nos. 0, 1, 2).

Notes:

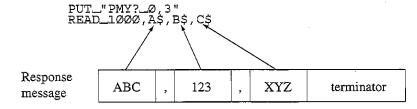

The RDPM is a dedicated statement for reading data from dual port memory.

(4) Details of write/read the dual-port memory

After executing statements shown on the above left, the contents of the dual-port memory are as shown on the above right.

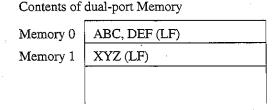

When these data are read using "PMY?" command, the following contents are stored in variables A\$, B\$, and C\$, respectively.

Comma <,> in dual-port memory

The output data for PMY? is assumed to be everything from the beginning to the <termination> code of the specified memory number. The output data includes the memory contents up to (but not including) the terminator. If a comma <,> is included in the contents, it indicates the presence of output data.

In contrast, data in the READ statements for the PTA and controller are separated by commas and sequentially assigned to data variables. Therefore, the number of output variables generated by the PMY? command may be different from the number of variables required for the corresponding statement.

Execute the statements shown below to read the contents of the dual-port memory at addresses 0 and 1.

The ABC represents data for variable A\$ and the DEF represents data for variable B\$. The contents of the memory 0 are separated by a comma (,). This comma separates the data into two data values. Consequently, the XYZ data in the memory 1 is not read. Therefore, the number of input variables in the READ statement must be set to three.

SECTION 8 PTA ERROR MESSAGES

TABLE OF CONTENTS

Error Message Format	8-4
ERROR Statement	8-5
ERRMAIN Statement	8-6
Error Processing Subroutines	8-7
ON ERROR statement	8-7
OFF ERROR statement	8-7
Returning from error processing subroutines	
(RETERR, RETRY, RESUME and GIVE UP statements)	8-7
ERRREAD (m) function	8-8
Error List	8-9

SECTION 8 PTA ERROR MESSAGES

An error message is displayed when an error is detected in the PTA command or program.

There are two types of errors;an execution-stop error (fatal: F) and an execution-continuable error (warning: W).

- Execution-stop error (F:Fatal):

 This type of error stops the execution of the program unconditionally.
- Execution-continuable error (W:Warning error):
 When there is no ERROR statement in the line next to the line where this type of error occurs, the execution stops; but if there is an ERROR statement, execution continues.
 And also, error interruption process can continue the execution.

Error Message Format

The error message is displayed in the following format.

• PTA program:

ERROR Error level Error number[,Error-occurrence line number]

This is displayed at the program execution.

• PTA library:

ERROR Error level Error No. [,erred line No.,erred program name]

This is displayed at program execution.

No.300 and on are errors of the library program itself.

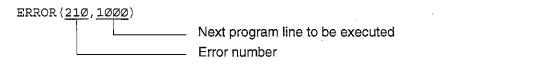

ERROR Statement

(1) Function

For an execution-continuable error generated at program execution, execution can be continued by using the ERROR statement.

An ERROR statement can be programed over several lines.

(2) Format

This statement means that when the error (generated in the previous line) corresponds to the error number 210,the program of line 1000 is executed.

When it does not correspond, the error message is displayed and execution stops.

(3) Example

```
10 X = 0  
20 Y = 100/X  
30 ERROR (210,100) ; If the error (210: the divisor is 0) occurs, jump to line 100.  
40 Y = Y+50
```

ERRMAIN Statement

(1) Function

To branch to the main routine whenever a execution continuable ERROR occurred, use the ERRMAIN statement.

(2) Format

ERRMAIN (error number)

(3) Example

```
1Ø INPUT A
2Ø GOSUB 1ØØØ
3Ø :
:
1ØØØ WRITE 217,A
1Ø1Ø ERRMAIN(222) ; If the error (222) occurs because the data of WRITE statement can not output, the program returns to the main routine.
```

Note: If the ERRMAIN statement has been executed in the highest level of the routine, ERROR 213 is generated.

Error Processing Subroutines

ON ERROR statement

(1) Function

Registers the subroutine to branch (interrupt) to when an error occurs.

(2) Format

ON ERROR line number (or *label)

After executing this statement and an error that is possible to continue execution occurs, an interrupt occurs and the error processing subroutine is executed from the line number (or label) specified.

OFF ERROR statement

(1) Function

Releases the registered subroutine to branch (interrupt) to when an error occurs.

(2) Format

OFF ERROR

After executing this statement, error interrupts will not occur.

Returning from error processing subroutines (RETERR, RETRY, RESUME and GIVE UP statements)

(1) Function

Returns from an error interrupt.

(2) Format

RETERR (Continues from the statement following the statement where the error occurred.)

RETRY (Continues reexecuting from the statement caused the error.)

RESUME (Continues from specified line.)

GIVEUP (Stops program execution.)

Note: See Section 4, "RETERR statement" to "GIVEUP statement".

ERRREAD (m) function

(1) Function

Reads the line where the error occurred and the error code in the middle of an error processing subroutine.

(2) Format

V=ERRREAD(Ø)

(Error code)

V=ERRREAD(1)

(Line where error occurred)

(3) Example

100 ON ERROR 200

; Jumps to line 200 on error

110 INPUT X

 $12\emptyset Y=1\emptyset\emptyset/X$

13Ø PRINT Y

14Ø GOTO 11Ø

15Ø STOP

200 C=ERRREAD(0)

21Ø IF C=21Ø GOSUB 3ØØ

; For "Divide by zero", continues to execute from line 130 $\,$

displaying "ERROR/0".

220 IF C<>210 GIVEUP

23Ø RETERR

300 PRINT "ERROR /0"

310 RETURN

; On other errors, stops program execution

Error List

Table 8-1 shows the error number and error cause. In the table, F (Fatal) denotes the execution-stop error and W (Warning) denotes the execution-continuable error.

Table 8-1 PTA Error List

Error No.	Cause of error	W,* F**
0	[كا] key pressed but no commands or statement input	F
1	Number of characters (representing variable) exceeds 8, or number of characters (representing program name) exceeds 6.	W
2	Format of numeric constant in correct Example: Ø1 4.5EE2	W
3	Too many input digits, or value of numeric constant too large or too small (Format of numeric constant incorrect)	w
4	Format of character string constant incorrect Example: A\$="ABC"	W
5	Format incorrect Example: PRINT A:G6.2	W
6	Statement cannot be interpreted (command format error) Example: GOTO ABC	w
7	Statement insufficiently described Example: GOTO	w
8	Statement excessively described Example: GOTO 100,200	W
9	Number of variables exceeds 256 (Up to 256 user-defined variables can be written)	w
10	Character cannot be interpreted Example: -100	w
11	Format (of binary or hexadecimal constant) incorrect Example: 8#=# 110	W
12	Value (of binary or hexadecimal constant) too large Binary constant: up to 8 characters Hexadecimal constant: up to 2 characters Example: 8#=#100000000	W
13	Number of format digits too large Example: PRINT A: F6.5	w

^{*}W: Execution-continuable error (Warning)

^{**}F: Executiong-stop error (Fatal error)

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
14	Command operand cannot be interpreted Example: LIST A,B	W
15	Command operand insufficient Example: LISTG	W
16	Command operand excessive Example: DELETE 10,100,300	W
17	Line number exceeds 65535 (Program line number is 1 to 65535)	W
20	Program on a line too long to assemble	W
21	Undefined-line-number label used as command operand	W

Note: Errors 0 to 21 may occur during program input or command execution. Errors 6 to 8, however, may also occur during statement execution.

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
. 101	Value of command operands 1 and 2 incorrect Example: LIST 100,10	F
102	Program exceeds memory capacity	F
103	No Line number or program, designated by command (LIST, LISTG, DELETE, RENUM, and SAVE commands)	F
104	Since number of GOTO or GOSUB statements excessive (>100), RENUM statement cannot be executed	F
105	Since line number (specified by GOTO or GOSUB operand) not found, RENUM statement cannot be executed	F
111	Line number exceeds 65535 when RENUM and PCOPY statements executed	F

Note: Errors 101 to 105 and 111 may occur during command execution.

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
120	Media write-protected	W
121	Media not installed	W
122	Media memory overflow	W
123	Specified program not stored in media	W.
124	Media faulty	w
125	Memory type incorrect	w
126	Media formatting incorrect	W
127	Media not formatted	W
150	Label is not defined or defined more than once	F
151	No DATA statement	F
180	Error of the command transmitted from PTA to main frame	W

Note: Errors 120 to 127 may occur when a command or statement attempts to access the media (PMC or FD).

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
201	Program cannot be resumed (CONT command)	F
202	Specified line number missing RUN command executed without program (RUN, CONT commands and GOTO, GOSUB statements)	W
203	Array subscript (in DIM statement) incorrect (The array subscript must be from 1 to 1024; the bit array subscript must be from 1 to 8, and the character array subscript must be from 1 to 255.)	W
204	Used as simple, or system variables before array declaration by DIM statement	W
205	Array declaration overlapped	W
206	Insufficient variable memory capacity due to program memory overflow	F
207	Arithmetic operation of character data or bit data	W.
208	Data-type combination incorrect for conversion	W
209	Overflow or underflow occurred	W
210	Divide by 0	W
211	Value of arithmetic function parameter too large or too small	W
212	Nesting (by subroutine, FOR and NEXT statement) exceeded 10 levels	F
213	No return destination specified for RETURN statement	F
214	Comparison cannot be made by IF statement Right and left side data-type combination incorrect	W

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
215	SOS statement is executed	F
216	No corresponding FOR statement. That is, there are excess NEXT statements. (RUN, CONT command and GOTO, GOSUB statements)	W
217	Input data format (in INPUT statement) incorrect	W
218	Input data (in INPUT statement) insufficient	W
219	Excess amount or too large input data in INPUT statement	W
220	Minus sign used in exponentiation Example: -1!5	W
221	Data can not be input in GPIB (Talker device not connected)	W
222	Data cannot be output in GPIB	W
223	Parameter (in the statement) outside range or variable type incorrect Example: WAIT A\$	W
224	Simple variable includes array subscript	w
225	Array variable has no subscript	W
226	Array-variable subscript out of boundary Note that the subscript range declared in DIM J(5) is J(0) to (4).	W
227	GPIB execution is impossible because the PTA is set as the device	w
228	GPIB execution is impossible because the PTA is set as the controller	W

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
229	STOP statement (to terminate program execution) not specified	w
230	Attempt made to refer to non-referable system variable	w
231	Attempt made to assign non-assignable system variable	W
232	Array variable subscript not numeric	F
233	Parameter (in boolean function) not bit type	W
234	Parameter of FOR statement is character or bit type	W
. 235	The I/O type specification in the EVENT statement is out of range (0 to 99).	W
236	Variable of NEXT statement does not correspond to that of FOR statement specified before NEXT statement Example: 3Ø FOR C= 9Ø NEXT D	W
237	Six or more character constants and variables used in INPUT, PRINT, READ or WRITE statement Example: PRINT"FREQ", F(C), "Hz", "LEVEL", LEV, "dBm"	W
238	Variable type and format type of PRINT or WRITE statement do not agree	W
239	Operand (in LISTG, WRITE or READ statement) outside range (0 to 31) Example: LISTG 35	W
240	Variable or constant values of CALL statement or system function outside range	W
241	Vairable or constant type of CALL statement or system function incorrect	W
242	System variable used in CALL statement or system function	W

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
243	The RETURN or RETMAIN statement was used to return from event or error interrupt processing.	F
244	Media data file not open	W
245	Media data file opened	W
246	Media data already read	w
247	Media data type and variable type combination incorrect (unconvertible)	W
248	Excess amount or too large input data value in READ statement.	W
249	Insufficient input data in READ statement	W
250	Input data format (in READ statement) incorrect	W
251	The RETINT statement was used for something other than event interrupt processing. Or, the GOSUB statement was executed in the middle of event interrupt processing and the RETURN statement to return was not executed, but the RETINT statement was instead.	F
252	The RETERR, RETRY, RESUME, GIVEUP statements were used for something other than error interrupt processing. Or, the GOSUB statement was executed in the middle of error interrupt processing. Or, the RETURN statement to return was not used and one of the above statements was executed.	· F
253	The ERRREAD function was executed for something other than error interrupt processing.	F
254	The STATUS function was executed for something other than event interrupt processing.	F

Table 8-1 PTA Error List (Continued)

Error No.	Cause of error	W, F
301	Library/program is being selected.	w
302	The specified measuring instrument library does not exist in the memory.	W
303	A program having the new program name specified by RENAME exists.	F
304	The file containing the same name as that of the program in execution was loaded.	W
305	The number of nesting by CALLIB has exceeded 10.	F
306	The library was executed during sequence registering/downloading.	F
307	The specified measuring instrument library is being executed.	W
308	The specified measuring instrument library is being locked.	W
309	Result of processing by the main frame's measuring instrument is abnormal.	W
310	The library is being registered.	· W
311	The LIBRARY statement cannot be edited.	W
312	CHKFILE was executed to the .MNU file.	W
313	The specified measuring instrument library resides in ROM.	W
314	The COMCLEAR statement cannot be executed in the nested PTA library.	W
